General Description

The are general purpose, low offset, high frequency response and low power operational amplifiers. With an excellent bandwidth of 1MHz, a slew rate of 1V/ μ s, and a quiescent current of 28 μ A per amplifier at 5V, the family can be designed into a wide range of applications.

The op-amps are designed to provide optimal performance in low voltage and low power systems. The input common-mode voltage range includes ground, and the maximum input offset voltage are 3mV. These parts provide rail-to-rail output swing into heavy loads.

The families of operational amplifiers are specified at the full temperature range of -40°C to +85°C under single or dual power supplies of 1.5V to 5.5V.

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) Input terminals are diode clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current limited to 10mA or less.
- (3) Output terminals are diode-clamped to the power-supply rails. Output signals that can swing more than 0.5V beyond the supply rails should be current-limited to ± 200 mA or less.
- (4) Short-circuit to ground, one amplifier per package.
