

Description

This single channel single-pole double-throw (SPDT) analog switch is designed for 1.65V to 5.5V V_{CC} operation. The NC7SB3157 device handles both analog and digital signals. The NC7SB3157 device allows signals with amplitudes of up to V_{CC} (peak) to be transmitted in either direction.

Applications include signal gating, chopping, modulation or demodulation (modem), and signal multiplexing for analog-to-digital and digital-to-analog conversion systems.

Features

- ESD protection exceeds JESD 22
 - 2000V Human Body Model
 - 1000V Charged-Device Model
- 1.65V to 5.5V V_{CC} operation
- Qualified for 125°C operation
- Specified break-before-make switching
- Rail-to-rail signal handling
- Operating frequency typically 340MHz at room temperature
- High speed, typically 2ns ($V_{CC} = 3V$, $C_L = 50pF$)
- Low ON-state resistance, typically approximately 4.5Ω
- Small package and footprint
 - SOT23-6L and SOT-363
- RoSH compatible

Simplified Schematic

Applications

- Wearables and mobile devices
- Portable computing
- Internet of things (IoT)
- Audio signal routing
- Remote radio unit
- Portable medical equipment
- Surveillance
- Home automation
- I2C/SPI/UART bus multiplexing
- Wireless charging

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current-limited to 100mA or less.

(3) The package thermal impedance is calculated in accordance with JESD-51.

(4) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PCB.

Application Information

The NC7SB3157 SPDT analog switch is flexible enough for use in a variety of circuits such as analog audio routing, power-up monitor, memory sharing, and so on.

Typical Application

Figure 14. Typical Application Schematic

Design Requirements

The inputs can be analog or digital, but recommends waiting until V_{CC} has ramped to before applying any signals. Appropriate termination resistors should be used depending on the type of signal and specification. The Select pin should not be left floating; either pull up or pull down with a resistor that can be overdriven by a GPIO.

Power Supply Recommendations

Most systems have a common 3.3V or 5V rail that can supply the V_{CC} pin of this device. If this is not available, a Switch-Mode-Power-Supply (SMPS) or a Linear Dropout Regulator (LDO) can be used to provide supply to this device from another voltage rail.

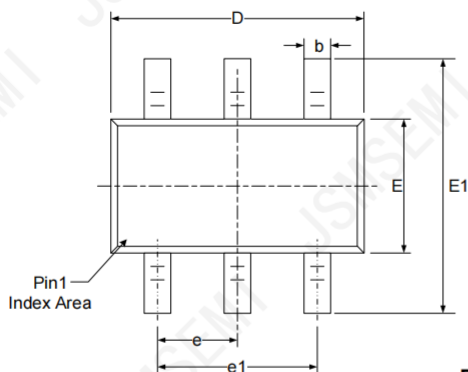

Layout

Layout Guidelines

Recommends keeping signal lines as short as possible. also recommends incorporating microstrip or stripline techniques when signal lines are greater than 1 inch in length. These traces must be designed with a characteristic impedance of either 50Ω or 75Ω, as required by the application. Do not place this device too close to high-voltage switching components, as they may interfere with the device.
