MP2128

2.5V-6V Input, 3MHz, 1A Synchronous Step-Down Converter

The Future of Analog IC Technology

DESCRIPTION

The MP2128 is a 3MHz constant frequency, current mode, PWM step-down converter with integrated main switch and synchronous rectifier that is ideal for powering portable equipment that runs from a single Li-Ion or Li-Polymer battery.

The MP2128 can supply up to 1A load current from a 2.5V to 6V input voltage. The output voltage can be as low as 0.6V.

Additional features include <1μA shutdown current, internal soft-start, cycle-by-cycle over current protection, short circuit protection, and thermal shutdown.

The MP2128 is available in low profile (1.5mm) 5-pin SOT23 and 8-pin, QFN8 2mm×2mm packages.

FEATURES

- High Efficiency: Up to 95%
- 3MHz Constant Switching Frequency
- 1A Available Load Current
- 2.5V to 6V Input Voltage Range
- Output Voltage as Low as 0.6V
- Current Mode Control
- Cycle-by-Cycle Over Current Protection
- Short Circuit Protection
- Thermal Shutdown
- <1μA Shutdown Current
- Internal Soft-Start
- Space Saving 5-Pin SOT23 Package and
- 8-pin, QFN8 2mm×2mm package

APPLICATIONS

- Cellular Phones
- Microprocessors and DSP Core Supplies
- PDAs and Smart Phones
- MP3 and Portable Media Players
- Digital Still and Video Cameras
- Portable Instruments

Thermal Resistance (4)

	θ_{JA}	θ_{JC}	
SOT23	220	110	°C/W
QFN8 (2mmx2mm)	50	12	°C/W

Notes:

1) Exceeding these ratings may damage the device.
2) The maximum allowable power dissipation is a function of the maximum junction temperature T_J (MAX), the junction-to-ambient thermal resistance θ_{JA}, and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = (T_J (MAX)-T_A)/θ_{JA}. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
3) The device is not guaranteed to function outside of its operating conditions.
4) Measured on JESD51-7, 4-layer PCB.

FUNCTIONAL DESCRIPTION

MP2128 is a 3MHz constant frequency, current mode, PWM step-down converter. The device integrates both a main switch and a synchronous rectifier, which provides high efficiency and eliminates an external Schottky diode. It is ideal for powering portable equipment that runs from a single Li-Ion or Li-Polymer battery.

The MP2128 can achieve 100% duty cycle. The duty cycle D of a step-down converter is defined as:

$$D = T_{ON} \times f_{OSC} \times 100\% \approx \frac{V_{OUT}}{V_{IN}} \times 100\%$$

Where,

Ton: Main Switch ON time

Fosc: Switching frequency (3MHz)

Vout: Output voltage

Vin: Input voltage

Peak Current Mode PWM Control

Slope compensated current mode PWM control provides stable switching and cycle-by-cycle current limit for superior load and line response and protection of the internal main switch and synchronous rectifier. The MP2128 switches at a constant frequency (3MHz) and regulates the output voltage. During each cycle the PWM comparator modulates the power transferred to the load by changing the inductor peak current based on the feedback error voltage.

During normal operation, the main switch is turned on for a certain time to ramp the inductor current at each rising edge of the internal oscillator, and switched off when the peak inductor current is above the error voltage.

When the main switch is off, the synchronous rectifier will be turned on immediately and stay on until the next cycle starts.

Dropout Operation

The MP2128 allows the main switch to remain on for more than one switching cycle and increases the duty cycle while the input voltage is dropping close to the output voltage. When the duty cycle reaches 100%, the main switch is held on continuously to deliver current to the output up to the PFET current limit. The output voltage then is the input voltage minus the voltage drop across the main switch and the inductor.

Short Circuit Protection

The MP2128 has short circuit protection. When the output is shorted to ground, the oscillator frequency is reduced to prevent the inductor current from increasing beyond the PFET current limit. The PFET current limit is also reduced to lower the short-circuit current. The frequency and current limit will return to the normal values once the short circuit condition is removed and the feedback voltage reaches 0.6V.

Maximum Load current

The MP2128 can operate down to 2.5V input voltage, however the maximum load current decreases at lower input due to large IR drop on the main switch and synchronous rectifier. The slope compensation signal reduces the peak inductor current as a function of the duty cycle to prevent sub-harmonic oscillations at duty cycles greater than 50%. Conversely the current limit increases as the duty cycle decreases.
