

CN2611, CN2612, CN2614

1.2MHz, 35uA, Single/Dual/Quad Rail-to-Rail Input and Output CMOS Operational Amplifier

Features

- Rail-to-Rail Input and Output
- Unit Gain Stable
- Low Offset Voltage: 0.5mV
- Supply Voltage Range: 2.2V to 5.5V
- Gain Bandwidth Product: 1.2MHz
- Slew Rate: 0.7V/us
- Micro Power: 0.035mA/Amplifier
Typical Supply Current
- Thermal Shutdown Protection Circuitry
- High Gain, CMRR, PSRR
- Small Packaging: Available in Green
SOT/SOP/DFN/MSOP/TSOP Packages

Applications

- Active Filters
- Photodiode Amplifier
- Piezoelectric Sensors
- Test Equipment
- Medical Instrumentation
- Audio Output
- Portable Systems
- Smoke Detectors
- Notebook PC
- Mobile Communication
- Sensor Interface
- Battery Equipment
- DSP Interface
- ASIC Input
- A/D Output Amplifier

Descriptions

The CN2611, CN2612, CN2614 families of products are rail-to-rail input and output operational amplifier offering low cost and high performance. They have a wide input common-mode voltage range and output voltage swing, running at single supply voltage from 2.2V to 5.5V.

The op-amps provide 1.2 MHz bandwidth at a low current consumption of 35uA per amplifier, offering excellent overall performance. The op-amps exhibit low noise and distortion, low offset and high output current capability, making this device an excellent choice for sensor interface, active filter, low voltage or battery-operated systems.

The CN2611, CN2612, CN2614 families of products are offered in Green SOT/SOP/DFN/MSOP/TSOP packages, and are specified over the extended -40°C to +125°C temperature range.

Device Information ⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE(NOM)
CN2611	SOT23-5	2.90mm×1.60mm
	SOT23-6	2.90mm×1.60mm
	SC70-5 (SOT353)	2.10mm×1.25mm
	SC70-6 (SOT363)	2.10mm×1.25mm
	SOIC-8 (SOP8)	4.90mm×3.90mm

	Junction, T _J		150	
	Storage, T _{stg}	-65	150	

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current-limited to 10mA or less.

(3) Output terminals are diode-clamped to the power-supply rails. Output signals that can swing more than 0.5V beyond the supply rails should be current-limited to ± 70 mA or less.

(4) Short-circuit to ground, one amplifier per package.

Note 1: Stresses listed as the above “Absolute Maximum Ratings” may cause permanent damage to the device.

These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Typical Performance Characteristics

At $T_A = +25^{\circ}\text{C}$, $V_S = \pm 2.5\text{V}$, $R_L = 100\text{k}\Omega$ connected to GND, unless otherwise noted.

Small Signal Response

$V_+ = 2.5\text{V}$, $V_- = -2.5\text{V}$, $G = 1$, $C_L = 100\text{pF}$, $R_L = 100\text{k}\Omega$ to GND

Large Signal Response

$V_+ = 2.5\text{V}$, $V_- = -2.5\text{V}$, $G = 1$, $C_L = 100\text{pF}$, $R_L = 100\text{k}\Omega$ to GND

Positive Overload Recovery

$V_+ = 2.5\text{V}$, $V_- = -2.5\text{V}$, $C_L = 100\text{pF}$, $R_L = 100\text{k}\Omega$ to GND

$G = 100$

Negative Overload Recovery

$V_+ = 2.5\text{V}$, $V_- = -2.5\text{V}$, $C_L = 100\text{pF}$, $R_L = 100\text{k}\Omega$ to GND,

$G = 100$

Output Voltage Swing vs Output Current

$V_+ = 2.5\text{V}$, $V_- = -2.5\text{V}$, $C_L = 100\text{pF}$, $R_L = 100\text{k}\Omega$ to GND

Output Voltage Swing vs Output Current

$V_+ = 1.2\text{V}$, $V_- = -1.2\text{V}$, $C_L = 100\text{pF}$, $R_L = 100\text{k}\Omega$ to GND

Overshoot (OS) vs Load Capacitance
 $V+=2.5V, V-=-2.5V, R_L=100k\Omega$ to GND

Overshoot (OS) vs Load Capacitance
 $V+=1.2V, V-=-1.2V, R_L=100k\Omega$ to GND

ICC vs Temp
 $V+=2.5V, V-=-2.5V, C_L=100pF, R_L=100k\Omega$ to GND

THD vs Frequency
 $V+=2.5V, V-=-2.5V, V_{in}=1V_{pp}, C_L=100pF, R_L=100k\Omega$ to GND

Power Supply Layout and Bypass

The CN261X OPA's power supply pin (VDD for single-supply) should have a local bypass capacitor (i.e., 0.01 μ F to 0.1 μ F) within 2mm for good high frequency performance. It can also use a bulk capacitor (i.e., 1 μ F or larger) within 100mm to provide large, slow currents. This bulk capacitor can be shared with other analog parts. Ground layout improves performance by decreasing the amount of stray capacitance and noise at the OPA's inputs and outputs. To decrease stray capacitance, minimize PC board lengths and resistor leads, and place external components as close to the op amps' pins as possible.

Proper Board Layout

To ensure optimum performance at the PCB level, care must be taken in the design of the board layout. To avoid leakage currents, the surface of the board should be kept clean and free of moisture. Coating the surface creates a barrier to moisture accumulation and helps reduce parasitic resistance on the board. Keeping supply traces short and properly bypassing the power supplies minimizes power supply disturbances due to output current variation, such as when driving an ac signal into a heavy load. Bypass capacitors should be connected as closely as possible to the device supply pins. Stray capacitances are a concern at the outputs and the inputs of the amplifier. It is recommended that signal traces be kept at least 5mm from supply lines to minimize coupling.

A variation in temperature across the PCB can cause a mismatch in the feedback voltages at solder joints and other points where dissimilar metals are in contact, resulting in thermal voltage errors. To minimize these thermocouple effects, orient resistors so heat sources warm both ends equally. Input signal paths should contain matching numbers and types of components, where possible to match the number and type of thermocouple junctions. For example, dummy components such as zero value resistors can be used to match real resistors in the opposite input path. Matching components should be located in close proximity and should be oriented in the same manner. Ensure leads are of equal length so that thermal conduction is in equilibrium. Keep heat sources on the PCB as far away from amplifier input circuitry as is practical.

The use of a ground plane is highly recommended. A ground plane reduces EMI noise and also helps to maintain a constant temperature across the circuit board.
