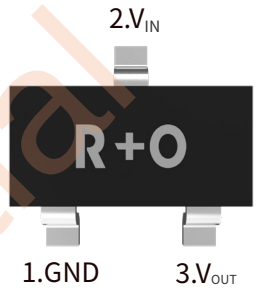
100mA CMOS Voltage Regulators

Features

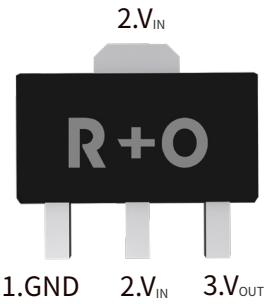
- Quiescent Current: 3.0μA
- Input Voltage Range: -0.3V to 24V
- Maximum Withstand Input Voltage: 30V
- Output Current: 100mA
- Low Dropout Voltage: 30mV(Typ.)@1mA
- Output Voltage: 2.0V, 2.4V, 2.5V, 2.8V, 3.0V, 3.3V, 3.6V, 4.0V, 4.4V, 5.0V
- Output Voltage Accuracy: ±3%(Typ.)

Output Current
100mA
Input Voltage
24/30V

SOT-23(-3L)



SOT-89



Applications

- Battery Power Supply Equipment
- Communication Equipment
- Audio/Video Equipment
- Laptop, Palmtops, Notebook Computers

General Description

The HT75 Series consists of a current limiter circuit,a driver transistor, a precision reference voltage and an error correction circuit. The series is compatible with low ESR ceramic capacitors. The current limiter's foldback circuit operates as a short circuit protection as well as the output current limiter for the output pin.

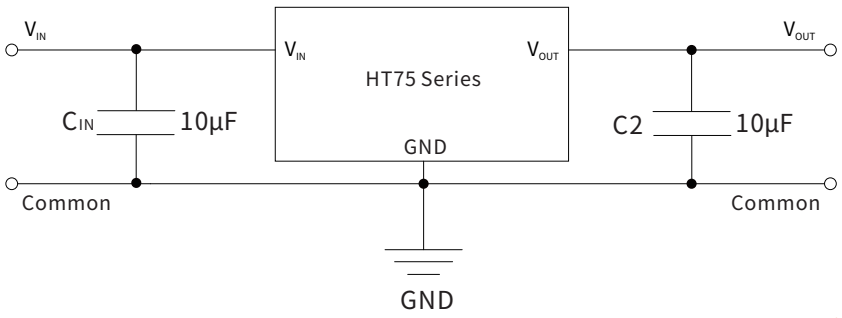
Typical Application Circuit



Absolute Maximum Ratings (T_A = 25°C Unless otherwise specified)

Parameter	Symbol	Value	Unit
Input Voltage/Limit	V_{IN}	24/30	V
Operating Current	I_O	100	mA
Power Dissipation	P_D	SOT89: 500	mW
		SOT-23(-3): 200	
Thermal Resistance Junction-Ambient	$R_{\theta JA}$	SOT89: 200	°C /W
		SOT-23(-3): 500	
Solder Temperature/Time	T_d	260/10	°C /S
Operating Ambient Temperature	T_A	-15 to +70	°C
Junction and Storage Temperature	T_J, T_{stg}	-50 to +125	°C

Note:Exceed these limits to damage to the device, exposure to Absolute Maximum Rating conditions may affect the reliability of the chip.

Electrical Characteristics(T_A = 25°C Unless otherwise specified)

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Input Voltage	V_{IN}	T_A = 25°C	--	24	--	V
Output Voltage	V_{OUT}	I_{OUT} = 10mA, V_{IN} = V_{OUT} + 2.0V	V_{OUT} × 0.97	V_{OUT}	V_{OUT} × 1.03	V
Output Current	I_O	V_{IN} = V_{OUT} + 2.0V	70	100	--	mA
Quiescent Current	I_Q	I_{OUT} = 0mA	--	1.5	3.0	μA
Line Regulation	$\triangle V_{OUT}/\triangle V_{IN}\cdot V_{OUT}$	I_{OUT} = 1mA V_{OUT} + 1.0V ⩽ V_{IN} ⩽ 24V	--	0.01	0.2	%/V
Load Regulation	$\triangle V_{OUT}$	1mA ⩽ I_{OUT} ⩽ 50mA V_{IN} = V_{OUT} + 2.0V	--	25	60	mV
Output Voltage Temperature Coefficient	$\triangle V_{OUT}/\triangle T_A\cdot V_{OUT}$	I_{OUT} = 10mA, V_{IN} = V_{OUT} + 2.0V T_A = -40 to 85°C	--	100	--	PPM/°C
Dropout Voltage	V_D	I_{OUT} = 1mA, $\triangle V_{OUT}$ = 2%	--	30	100	mV

Note:The dropout voltage is defined as V_{IN} − V_{OUT}, when V_{OUT} is 98% of the normal value of V_{OUT}.

Functional Description

Input Capacitor

A 10μF ceramic capacitor is recommended to connect between V_{IN} and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both V_{IN} and GND.

Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended minimum output capacitance is 2.2μF, Tantalum capacitor is recommended, and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot.
Place output capacitor as close as possible to V_{OUT} and GND pins.

Thermal Considerations

For continuous operation, do not exceed absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated by the following formula :$P_{D(MAX)} = (T_{J(MAX)} - T_A) / R_{\theta JA}$.
Where $T_{J(MAX)}$ is the maximum operation junction temperature 125°C , T_A is the ambient temperature and the $R_{\theta JA}$ is the junction to ambient thermal resistance.The power dissipation definition in device is： $P_D = (V_{IN} - V_{OUT}) * I_{OUT} + V_{IN} * I_Q$.

Input Resistance

Place a resistor with an appropriate resistance in series before the V_{IN} of the LDO, which can help the device dissipate some energy during surges. The resistance of the resistor should not be too large. The specific resistance value depends on the application of the circuit. Generally, the resistance of such a resistor should not exceed 20Ω.

Layout Consideration

By placing input and output capacitors on the same side of the PCB as the LDO, and placing them as close as is practical to the package can achieve the best performance. The ground connections for input and output capacitors must be back to the HT75 Series ground pin using as wide and as short of a copper trace as is practical.Connections using long trace lengths, narrow trace widths, and connections through via must be avoided. These add parasitic inductances and resistance that results in worse performance especially during transient conditions.
