

## 2-Kbit I<sup>2</sup>C-compatible Serial EEPROM

### Features

- Supply Voltage Range: 1.7V to 5.5V
- 2-wire Serial Interface I<sup>2</sup>C Compatible
  - 400 kHz and High Speed 1MHz Transfer Rate Compatibility
- Byte and Page (up to 16 Bytes) Write Mode
  - Partial Page Write Allowed
- Self-timed Write Cycle (3ms Maximum)
- Additional 16-byte Write Lockable Page and 128-bit Unique ID
- Hardware and Software Write Protection on the Whole Memory Array
- Schmitt Trigger, Filtered Inputs for Noise Suppression
- High Reliability
  - Endurance: 2,000,000 Write Cycles
  - Data Retention: 200 Years
  - ESD Protection (Human Body Model): 5000V
- Low Operating Current
  - Write Current: 0.5mA (Maximum)
  - Read Current: 0.5mA (Maximum)
  - Standby Current: 1μA (Maximum)
- Operating Temperature Range: -40°C to +105°C
- Green Packaging Options (RoHS Compliant, Pb/Halogen-free)
  - DIP-8/SOP-8/MSOP-8/TSSOP-8/DFN-8/SOT-23-5

### Ordering Information

| DEVICE         | Package Type | MARKING | Packing | Packing Qty  |
|----------------|--------------|---------|---------|--------------|
| HG24C02CN      | DIP-8        | 24C02C  | TUBE    | 2000pcs/box  |
| HG24C02CM/TR   | SOP-8        | 24C02C  | REEL    | 2500pcs/reel |
| HG24C02CMM/TR  | MSOP-8       | C02C    | REEL    | 3000pcs/reel |
| HG24C02CM5/TR  | SOT-23-5     | 2CMU    | REEL    | 3000pcs/reel |
| HG24C02CMT/TR  | TSSOP-8      | 24C02C  | REEL    | 5000pcs/reel |
| HG24C02CDQ3/TR | DFN-8 3*3    | C02C    | REEL    | 5000pcs/reel |
| HG24C02CDQ2/TR | DFN-8 2*2    | C02C    | REEL    | 5000pcs/reel |

## Description

The HG24C02C is a 2-Kbit I<sup>2</sup>C-compatible serial EEPROM device. The device is designed to operate in a supply voltage range of 1.7V to 5.5V, with a maximum of 1MHz transfer rate, over an operating temperature range of -40°C to +105°C. The device incorporates a Write Protection pin used for hardware Write Protection on the whole memory array. The device also offers a Software Write Protection feature for users to write protect the whole memory array.

The memory array is organized as 16 pages of 16 bytes each, totaling 256\*8 bits. The device offers an additional 16-byte Identification Page for users to store sensitive application parameters. This page can be permanently locked in Read-only mode after the data is written into the Identification Page. The device also offers a separate memory block (in Read-only mode) containing a factory programmed 128-bit Unique ID and can be accessed to by sending a specific Read command.

The HG24C02C is delivered in lead-free green packages: DIP-8, SOP-8, MSOP-8, DFN-8 and SOT23-5.

## Pin Configuration

## Pin Descriptions

| Symbol         | Type         | Name and Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E0<br>E1<br>E2 | Input        | <b>Device Address Inputs:</b> The E0, E1, and E2 pins are device address inputs for compatibility with other 2-wire serial EEPROM devices. These pins can be directly connected to VCC or GND in any combination, allowing up to eight devices on a single bus system. If these pins are left floating, the E0, E1, and E2 pins will be internally pulled down to GND.                                                                                                                                                        |
| SDA            | Input/Output | <b>Serial Data:</b> The SDA pin is an open-drain bidirectional input/output pin used to serially transfer data to and from the device.                                                                                                                                                                                                                                                                                                                                                                                        |
| SCL            | Input        | <b>Serial Clock:</b> The SCL pin is used to provide a clock to the device and is used to control the flow of data to and from the device. Command and input data present on the SDA pin is always latched in on the rising edge of SCL, while output data on the SDA pin is always clocked out on the falling edge of SCL.                                                                                                                                                                                                    |
| VCC            | Power        | <b>Device Power Supply:</b> The VCC pin is used to supply the source voltage to the device. Operations at invalid VCC voltages may produce spurious results and should not be attempted.                                                                                                                                                                                                                                                                                                                                      |
| GND            | Power        | Ground: The ground reference for the power supply. GND should be connected to the system ground.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| WP             | Input        | <b>Write Protection:</b> The WP pin is used to write protect the entire contents of the memory. When the WP pin is connected to Power Supply, the entire memory array becomes Write-protected, that is, the device becomes Read-only. When the WP pin is connected to GND, Write operations are enabled. If the pin is left floating, the WP pin will be internally pulled down to GND. When the WP pin is driven high, the device address byte and the word address bytes are acknowledged, data bytes are not acknowledged. |

## Functional Block Diagram

## Device Communication

The HG24C02C operates as a Slave and utilizes a 2-wire serial interface to communicate with the Master. The Master initiates and controls all Read and Write operations to the slave devices on the serial bus, and both the Master and the slave devices can transmit and receive data on the bus.

The serial interface is comprised of just two signal lines: the Serial Clock (SCL) and the Serial Data (SDA). Data is always latched into the HG24C02C on the rising edge of SCL and is always output from the device on the falling edge of SCL. Both the SCL pin and SDA pin incorporate integrated spike suppression filters and Schmitt Triggers to minimize the effects of input spikes and bus noise.

All command and data information is transferred with the Most Significant Bit (MSB) first. During the bus communication, one data bit is transmitted every clock cycle, and after eight bits of data has been transferred, the receiving device must respond with an acknowledge or a no-acknowledge response bit during a ninth clock cycle generated by the Master. Therefore, nine clock cycles are required for every one byte of data transferred. There is no unused clock cycle during any Read or Write operation, so there must not be any interruptions or breaks during the data stream.

During data transfers, data on the SDA pin must only change while SCL is low, and the data must remain stable while SCL is high. If data on the SDA pin changes while SCL is high, then either a Start or a Stop condition will occur. The number of data bytes transferred between a Start and a Stop condition is not limited and is determined by the Master.

### Start Condition

A Start condition occurs when there is a high-to-low transition on the SDA pin while the SCL pin is stable in Logic 1 state. The Start condition must precede any command as the Master uses a Start condition to initiate any data transfer sequence (see **Figure 1**). The HG24C02C will continuously monitor the SDA and SCL pins for a Start condition, and the device will not respond unless one is given.

**Figure 1 Start, Stop, and ACK**

## Stop Condition

A Stop condition occurs when there is a low-to-high transition on the SDA pin while the SCL pin is stable in Logic 1 state (see **Figure 1**). A stop condition terminates communication between the device and the Master. A Stop condition at the end of a Write command triggers the EEPROM internal write cycle. Otherwise, the device subsequently returns to Standby mode after receiving a Stop condition.

## Acknowledge (ACK)

After each byte of data is received, the HG24C02C should acknowledge to the Master that it has received the data byte successfully. This is accomplished by the Master first releasing the SDA line and providing the ACK/NACK clock cycle (a ninth clock cycle for every byte). During the ACK/NACK clock cycle, the device must output Logic 0 as ACK for the entire clock cycle so that the SDA line must be stable in Logic 0 state during the entire high period of the clock cycle (see **Figure 1**).

## Standby Mode

The HG24C02C features a low-power Standby mode which is enabled:

- (1) Upon power-up;
- (2) After the receipt of a Stop condition in Read operation;
- (3) The completion of any internal operations.

## Software Reset

After an interruption in protocol, power loss, or system reset, any 2-wire part can be reset by following these steps: (1) Create a Start condition; (2) Clock nine cycles; (3) Create another Start condition followed by a Stop condition (see **Figure 2** ).

**Figure 2-wire Software Reset**

---

## Device Reset and Initialization

The HG24C02C incorporates a Power-On Reset (POR) circuit to prevent inadvertent operations during power-up. On a cold power-up, the device does not respond to any instructions until the supply voltage reaches the internal power-on reset threshold voltage (VPOR). The supply voltage must rise continuously between VPOR and minimum VCC without any ring back to ensure a proper power-up. Once the supply voltage passes VPOR, the device is reset and enters Standby mode. However, no protocol should be issued to the device until a valid and stable supply voltage is applied. The supply voltage must remain stable and valid until the end of the protocol transmission, and for a Write instruction, until the end of the internal write cycle.

This POR behavior is bi-directional. It protects the HG24C02C against brown-out failure caused by a temporary loss of power. In a similar way, as soon as the supply voltage drops below the internal brown-out reset threshold voltage (VBOR), the device is reset and stops responding to any instructions.

## Data Security

The HG24C02C incorporates a hardware data protection feature that allows the user to write protect the whole memory array (and Identification Page) when the WP pin is connected directly to VCC.

The HG24C02C also offers a Software Write Protection (SWP) feature that allows the user to write protect the whole memory array (and Identification Page) when the internal non-volatile SWP bit is set to Logic 1.

## Device Addressing

The HG24C02C requires a 7-bit device address and a Read/Write select bit following a Start condition from the Master to initiate communication with the serial EEPROM. The device address byte is comprised of a 4-bit device type identifier followed by three device address bits (E2, E1, E0) and a  $R/\bar{W}$  select bit, and is clocked by the Master on the SDA pin with the most significant bit (MSB, bit 7) first.

The device will respond to two unique device type identifiers. The device type identifier of '1010' is necessary to select the device memory for normal Read or Write operation. The device type identifier of '1011' is used (1) to select the Identification Page for Read or Write/Lock operation; (2) to select the Software Write Protection bit for Read or Write operation; (3) for Read Unique ID (see **Table 1**).

The software device address bits (E2, E1 and E0) must match their corresponding hard-wired device address inputs (E2, E1 and E0), allowing up to eight devices on the bus at the same time. The eighth bit of the address byte is the  $R/\bar{W}$  operation selection bit. A Read operation is selected if this bit is Logic 1, and a Write operation is selected if this bit is Logic 0. Upon a compare of the device address byte, the HG24C02C outputs an ACK or a NACK during the ninth clock cycle if the compare is true or not true, respectively. The device will return to the low-power Standby mode after a NACK.

**Table 1 HG24C02C Device Address Byte**

| Function                                         | Device Type Identifier |       |       |       | Device Address |       |       | Read/Write  |
|--------------------------------------------------|------------------------|-------|-------|-------|----------------|-------|-------|-------------|
|                                                  | bit 7                  | bit 6 | bit 5 | bit 4 | bit 3          | bit 2 | bit 1 | bit 0       |
| When accessing the 2-Kbit memory array           | 1                      | 0     | 1     | 0     | E2             | E1    | E0    | $R/\bar{W}$ |
| When accessing the Identification Page           | 1                      | 0     | 1     | 1     | E2             | E1    | E0    | $R/\bar{W}$ |
| When accessing the Lock Identification Page bit  | 1                      | 0     | 1     | 1     | E2             | E1    | E0    | 0           |
| When accessing the Software Write Protection bit | 1                      | 0     | 1     | 1     | E2             | E1    | E0    | $R/\bar{W}$ |
| When accessing the Unique ID                     | 1                      | 0     | 1     | 1     | E2             | E1    | E0    | 1           |

Once the HG24C02C has acknowledged the device address byte, the device waits for the Master to send the word address byte for a certain Read or Write instruction according to **Table 2**. The device should respond to the word address byte with an ACK.

**Table 2 HG24C02C Word Address Bits**

| Function                       | Word Address Byte |       |                  |       |       |       |       |       |
|--------------------------------|-------------------|-------|------------------|-------|-------|-------|-------|-------|
|                                | bit 7             | bit 6 | bit 5            | bit 4 | bit 3 | bit 2 | bit 1 | bit 0 |
| Random Read                    | A7 <sup>[1]</sup> | A6    | A5               | A4    | A3    | A2    | A1    | A0    |
| Byte/Page Write                | A7                | A6    | A5               | A4    | A3    | A2    | A1    | A0    |
| Read/Write Identification Page | 0                 | 0     | X <sup>[2]</sup> | X     | A3    | A2    | A1    | A0    |
| Lock Identification Page       | 0                 | 1     | X                | X     | X     | X     | X     | X     |
| Read Lock Status               | 0                 | 0     | X                | X     | X     | X     | X     | X     |

| Read Unique ID                 | 1                 | 0     | X                | X     | A3    | A2    | A1    | A0    |

Notes: <sup>[1]</sup> A = Significant address bit.

<sup>[2]</sup> X = Bit is Don't Care

## Read and Write Operations

### Write Operations

#### Byte Write

For a Byte Write operation, the Master sends a Start condition followed by the device type identifier of '1010', the device address bits and the  $R/\bar{W}$  select bit set to Logic 0. The HG24C02C responds with an ACK during the ninth clock cycle and waits for the Master to send one word address byte. Then the device responds to the word address byte with an ACK. After receiving ACK from the HG24C02C, the Master transmits one data byte. If the addressed location has been Write-protected, by the WP pin connected to VCC or the SWP bit set to Logic 1, the device responds with a NACK, and the location is not modified. If the addressed location is not Write-protected, by the WP pin set to GND and the SWP bit set to Logic 0, the device will respond with an ACK (see **Figure 3** and **Figure 4**). The Master ends the Byte Write sequence with a Stop condition during the 10th clock cycle to initiate the internally self-timed write cycle. A Stop condition issued during any other clock cycle during the Write operation will not trigger the internal write cycle.

Once the write cycle begins, the preloaded data word will be programmed in the amount of time not to exceed the  $t_{WR}$  specification (see **Figure 7**). During the time, the Master should wait a fixed time by the  $t_{WR}$  specification, or for time sensitive applications, an ACK polling routine can be implemented. All inputs are ignored by the device during the write cycle and the device will not respond until the write cycle is completed. The serial EEPROM will increment its internal address counter each time a byte is written.

**Figure 3 Byte Write Operation with Write Protection Pin Set to Low (and SWP bit = 0)**

**Figure 4 Byte Write Operation with Write Protection Pin Set to High (or SWP bit = 1)**

## Page Write

The 2-Kbit serial EEPROM is capable of writing up to 16 data bytes at a time by executing the Page Write sequence. A partial or full Page Write operation is initiated the same as a Byte Write operation except that the Master does not send a Stop condition after the first data word is clocked in. Instead, after the device has acknowledged to the first data word, the Master can transmit up to fifteen more data words. The device responds with an ACK after each data word is received if the WP pin is set to GND and the SWP bit set to Logic 0, while the device is not acknowledged to each data word and the addressed locations are not modified if the WP pin is connected to VCC or the SWP bit set to Logic 1 (see **Figure 5** and **Figure 6**). After the device acknowledges to the last data word, the Master should terminate the Page Write sequence with a Stop condition to start the internal write cycle. A Stop condition issued at any other clock cycle will not initiate the internally self-timed write cycle and the Write sequence will have to be repeated again. Once the write cycle begins, the data words should be programmed in the amount of time not exceeding the tWR specification (see **Figure 7**). During this time, the Master should wait a fixed time by the specified tWR parameter, or for time sensitive applications, an ACK polling routine can be implemented.

The lower four bits of the word address are internally incremented following the receipt of each data word. The higher word address bits are not incremented, retaining the memory page row location. When the internally generated word address reaches the page boundary, then the following data word is placed at the beginning of the same page. If more than sixteen data words are transmitted to the device, the data word address will roll over and the previous data will be overwritten. The address roll-over during a Write sequence is from the last byte of the current page to the first byte of the same page.

**Figure 5 Page Write Operation with Write Protection Pin Set to Low (and SWP bit = 0)**

**Figure 6 Page Write Operation with Write Protection Pin Set to High (or SWP bit = 1)**

## Write Cycle Timing

The length of the self-timed write cycle, or  $t_{WR}$ , is defined as the amount of time from a valid Stop condition that begins the internal write sequence to the Start condition of the first device address byte sent to the HG24C02C that it subsequently responds to with an ACK (see **Figure 7**).

**Figure 7 Write Cycle Timing**

## Acknowledge (ACK) Polling

An ACK polling routine can be implemented to optimize time sensitive applications that would not prefer to wait the fixed maximum write cycle time but would prefer to know immediately when the serial EEPROM write cycle has completed to start a subsequent operation. Once the internally self-timed write cycle has started, the device inputs are disabled and ACK polling can be initiated. An ACK polling routine involves sending a valid Start condition followed by the device address byte. While the write cycle is in progress, the device will not respond with an ACK, indicating the device is busy writing data. Once completed, the device returns an ACK and the next device operation can be started (see **Figure 8**).

**Figure 8 Acknowledge Polling Flow Chart**

## Write Identification Page

The device offers a 16-byte Identification Page (ID Page) in addition to the 2-Kbit memory array for storage of specific application data. This Identification Page can be written and permanently locked in Read-only mode after the data is written into this Page. The Identification Page is written by issuing the Write Identification Page instruction (see **Figure 9**), which is similar to Page Write, except that:

- The device type identifier is defined as '1011';
- The word address bits A7:A6 must be '00', bits A5:A4 are Don't Care;
- The word address bits A3:A0 define the byte locations inside the ID Page (see **Table 2**).

If the Identification Page has been locked, the data bytes transferred during the Write Identification Page instruction will not be acknowledged.

**Figure 9 Write Identification Page**

## Lock Identification Page

The Lock Identification Page (Lock ID) instruction permanently locks the Identification Page in Read-only mode. The Lock ID instruction is similar to Byte Write, except the following specific conditions:

- The device type identifier is defined as '1011';
- The word address bits A7:A6 must be '01' and other word address bits are Don't Care;
- The data byte must be equal to the binary value xxxx\_xx1x, where x is Don't Care (see **Figure 10**).

Once a valid Lock ID instruction has been executed, if another Lock ID instruction is issued, the device will respond with a NACK to the data byte.

**Figure 10 Lock Identification Page**

## Software Write Protection (SWP)

In order to prevent unwanted Write sequence, the HG24C02C offers an internal non-volatile SWP bit, which makes it possible to protect the content in the whole memory array (and Identification Page). Updating the SWP bit to a new value is a reversible action by performing the Write SWP Bit instruction. This instruction is similar to Byte Write, except that:

- The device type identifier is defined as '1011';
- The word address bits A7:A6 must be '11' and other word address bits are Don't Care;
- The higher seven bits of the data word byte are Don't Care and bit 0 (D0) configures the SWP bit (see **Figure 11**). The SWP bit can be updated from Logic 0 to 1 and from Logic 1 to 0. Write operations are disabled (Read-only) when the SWP bit is set to Logic 1, while Write operations are enabled when the SWP bit is set to Logic 0.

Writing more than one byte will discard the write cycle and the value of SWP bit will not be changed.

Note that the device also incorporates a Write Protection pin used for hardware Write Protection. Either connecting the WP pin directly to VCC or setting the SWP bit to Logic 1 will write protect the whole memory array (and Identification Page). Writing the SWP bit is performed independently of the state of the WP pin connection. Upon a certain instruction send by the Master, the device will automatically load the last configuration of the SWP bit.

**Figure 11 Write SWP Bit**

## Read Operations

All Read operations are initiated by the Master transmitting a Start condition, a device type identifier of '1010' or '1011', three software device address bits (E2, E1, E0) that match corresponding hard-wired address pins (E2, E1, E0), and the R/W select bit with Logic 1 state. In the following clock cycle, the HG24C02C should respond with an ACK. The subsequent protocol depends on the type of Read operation desired. There are three Read operations for memory array: Current Address Read, Random Address Read, and Sequential Read with the device type identifier of '1010'; four Read operations for Identification Page, SWP bit and Unique ID: Read Identification Page, Read the Lock Status, Read SWP Bit and Read Unique ID with the device type identifier of '1011'. Read operations are performed independently of the state of the WP pin connection and the value of SWP bit.

### Current Address Read

For a Current Address Read operation, the Master sends a Start condition followed by transmitting the device address byte with the R/W bit set to Logic 1 (see **Figure 12**). The HG24C02C should respond with an ACK and then serially transmits the data word addressed by the internal address counter. This address maintained by the internal address counter is the last address accessed during the last Read or Write operation. The counter is then incremented by one and the address will stay valid between operations as long as power to the device is supplied. The address roll-over during a Read operation is from the last byte of the last page to the first byte of the first page. To end the command, the Master responds with a NACK followed by a Stop condition.

Note that the internal address counter value is defined by instructions accessing the 2-Kbit memory or the Identification Page or the Unique ID. For example, when accessing the ID Page, the counter value is loaded with the byte location in the ID Page. Therefore the next Current Address Read in the memory uses this new address counter value. When accessing the memory, it is recommended to always use Random Read instruction instead of Current Address Read instruction.

**Figure 12 Current Address Read**

## Random Read

A Random Read operation allows the Master to access any memory location in a random manner and requires a dummy write sequence to preload the starting data word address. To perform a Random Read, the device address byte and the word address bytes are transmitted to the HG24C02C as part of the dummy write sequence (see **Figure 13** bytes are clocked in and acknowledged by the HG24C02C, the Master must generate another Start condition. The Master initiates a Current Address Read by sending another device address byte with the  $R/\bar{W}$  bit set to Logic 1. The HG24C02C responds with an ACK to the device address byte and serially clocks out the first data word and increments its internal address counter. The device will continue to transmit sequential data words as long as the Master continues to acknowledge each data word. To end the sequence, the Master responds with a NACK followed by a Stop condition.

**Figure 13 Random Read**

## Sequential Read

A Sequential Read operation is initiated in the same way as either a Current Address Read or a Random Read, except that after the HG24C02C transmitting the first data word, the Master responds with an ACK instead of a NACK. As long as the HG24C02C receives an ACK, it will continue to increment the data word address and serially clock out the sequential data words (see **Figure 14**). When the internal address counter is at the last byte of the last page, the word address will roll over to the beginning of the memory array and the Sequential Read operation will continue. The Sequential Read operation is terminated by the Master responding with a NACK followed by a Stop condition.

**Figure 14 Sequential Read**

## Read Identification Page

The Identification Page can be read by issuing a Read Identification Page instruction. This instruction uses the same protocol and format as Random Read, except that:

- The device type identifier is defined as '1011';
- The word address bits A7:A6 must be '00', bits A5:A4 are Don't Care;
- The word address bits A3:A0 define the byte locations inside the ID Page (see **Table 2**).

When the end of Identification Page is reached, the word address will roll over to the beginning of the Identification Page. The Read Identification Page operation is terminated by the Master responding with a NACK followed by a Stop condition (see **Figure 15**).

**Figure 15 Read Identification Page**

## Read Unique ID

The HG24C02C offers a separate memory block containing a factory programmed 128-bit Unique ID (UID), or Serial Number. Reading the Serial Number is similar to Sequential Read, except that:

- The device type identifier is defined as '1011';
- The word address bits A7:A6 must be '10', bits A5:A4 are Don't Care;
- The word address bits A3:A0 define the byte locations inside the Unique ID (see **Table 2**).

In order to guarantee a unique number, the entire 128-bit value must be read from the starting address of the Serial Number block. Reading from a location other than the first address of the block will not result in a unique Serial Number. To read the first byte of the Serial Number, the word address bits A3:A0 need to be '0000'. Writing or altering the 128-bit Unique ID is not allowed. When the end of the 128-bit UID block is reached (16 bytes of data), the word address will roll over to the beginning of the 128-bit UID block. The Read Unique ID operation is terminated when the Master responds with a NACK to the data byte followed by a Stop condition (see **Figure 18**).

**Figure 18 Read Unique ID**

## Electrical Specifications

### Absolute Maximum Ratings

| Symbol           | Parameter                                | Value        | Unit |
|------------------|------------------------------------------|--------------|------|
|                  | Ambient temperature with power applied   | -55 to +130  | °C   |
| T <sub>STG</sub> | Storage temperature                      | -65 to +150  | °C   |
| V <sub>CC</sub>  | Supply voltage                           | -0.5 to +6.0 | V    |
| V <sub>IN</sub>  | Voltage on input Pins                    | -0.5 to +6.0 | V    |
| V <sub>ESD</sub> | Electrostatic pulse (human body model)   | 5000         | V    |
| T <sub>L</sub>   | Lead Temperature (Soldering, 10 seconds) | 260          | °C   |

**Note:** Stresses beyond those listed under 'Absolute Maximum Ratings' may cause permanent damage to the device. Functional operation of the device at these ratings or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### DC Characteristics

Operating range: T<sub>A</sub> = -40°C to +105°C, V<sub>CC</sub> = 1.7V to 5.5V (unless otherwise noted).

|--------|-----------------------|-----------------|-------|-----------------------------------------|
| NW     | Write Cycle Endurance | $2 \times 10^6$ | cycle | $T_A = +25^{\circ}\text{C}$ , Page Mode |
| $D_R$  | Data Retention        | 200             | year  | $T_A = +25^{\circ}\text{C}$             |

## Initial Delivery State

The HG24C02C serial EEPROM is delivered as follows:

- All bits in the memory array are set to '1' (each byte contains FFh).
- All bits in the Identification Page are set to '1' (each byte contains FFh).
- The Software Write Protection bit is set to '0'.

## Physical Dimensions

### SOP-8

| Dimensions In Millimeters(SOP-8) |      |      |      |      |      |      |    |      |          |
|----------------------------------|------|------|------|------|------|------|----|------|----------|
| Symbol:                          | A    | A1   | B    | C    | C1   | D    | Q  | a    | b        |
| Min:                             | 1.35 | 0.05 | 4.90 | 5.80 | 3.80 | 0.40 | 0° | 0.35 | 1.27 BSC |
| Max:                             | 1.55 | 0.20 | 5.10 | 6.20 | 4.00 | 0.80 | 8° | 0.45 |          |

### MSOP-8

| Dimensions In Millimeters(MSOP-8) |      |      |      |      |      |      |    |      |          |
|-----------------------------------|------|------|------|------|------|------|----|------|----------|
| Symbol:                           | A    | A1   | B    | C    | C1   | D    | Q  | a    | b        |
| Min:                              | 0.80 | 0.05 | 2.90 | 4.75 | 2.90 | 0.35 | 0° | 0.25 | 0.65 BSC |
| Max:                              | 0.90 | 0.20 | 3.10 | 5.05 | 3.10 | 0.75 | 8° | 0.35 |          |

## Physical Dimensions

### DFN-8 3\*3

| Dimensions In Millimeters(DFN-8 3*3) |      |      |      |      |      |      |      |          |
|--------------------------------------|------|------|------|------|------|------|------|----------|
| Symbol:                              | A    | A1   | B    | B1   | E    | F    | a    | b        |
| Min:                                 | 0.85 | 0.00 | 2.90 | 2.90 | 0.20 | 0.30 | 0.20 | 0.65 BSC |
| Max:                                 | 0.95 | 0.05 | 3.10 | 3.10 | 0.25 | 0.50 | 0.34 |          |

### SOT-23-5

| Dimensions In Millimeters(SOT-23-5) |      |      |      |      |      |      |    |      |          |          |
|-------------------------------------|------|------|------|------|------|------|----|------|----------|----------|
| Symbol:                             | A    | A1   | B    | C    | C1   | D    | Q  | a    | b        | e        |
| Min:                                | 1.00 | 0.00 | 2.82 | 2.65 | 1.50 | 0.30 | 0° | 0.30 | 0.95 BSC | 1.90 BSC |
| Max:                                | 1.15 | 0.15 | 3.02 | 2.95 | 1.70 | 0.60 | 8° | 0.50 |          |          |

## Physical Dimensions

TSSOP-8 (4.4\*3.0)

**Dimensions In Millimeters(TSSOP-8)**

| Symbol: | A    | A1   | B    | C    | C1   | D    | Q  | a    | b        |
|---------|------|------|------|------|------|------|----|------|----------|
| Min:    | 0.85 | 0.05 | 2.90 | 6.20 | 4.30 | 0.40 | 0° | 0.20 | 0.65 BSC |
| Max:    | 0.95 | 0.20 | 3.10 | 6.60 | 4.50 | 0.80 | 8° | 0.25 |          |

DIP-8

**Dimensions In Millimeters(DIP-8)**

| Symbol: | A    | B    | D    | D1   | E    | L    | L1   | a    | b    | c    | d        |
|---------|------|------|------|------|------|------|------|------|------|------|----------|
| Min:    | 6.10 | 9.00 | 8.10 | 7.42 | 3.10 | 0.50 | 3.00 | 1.50 | 0.85 | 0.40 | 2.54 BSC |
| Max:    | 6.68 | 9.50 | 10.9 | 7.82 | 3.55 | 0.70 | 3.60 | 1.55 | 0.90 | 0.50 |          |

## Physical Dimensions

DFN-8 2\*2

| Dimensions In Millimeters(DFN-8 2*2) |      |      |      |      |      |      |      |         |
|--------------------------------------|------|------|------|------|------|------|------|---------|
| Symbol:                              | A    | A1   | B    | B1   | E    | F    | a    | b       |
| Min:                                 | 0.85 | 0    | 1.90 | 1.90 | 0.15 | 0.25 | 0.18 | 0.50TYP |
| Max:                                 | 0.95 | 0.05 | 2.10 | 2.10 | 0.25 | 0.45 | 0.30 |         |

## Revision History

| REVISION<br>NUMBER | DATE    | REVISION                                                    | PAGE   |
|--------------------|---------|-------------------------------------------------------------|--------|
| V1.0               | 2014-6  | New                                                         | 1-27   |
| V1.1               | 2018-7  | Added DIP-8 package、Update DIP-8 Physical dimension         | 1、 25  |
| V1.2               | 2024-11 | Write Cycle Time 3mS Change 5mS.、 Update Lead Temperature   | 20、 22 |
| V1.3               | 2025-11 | Update important statements、 Update SOP-8 Dimension drawing | 23、 27 |

**IMPORTANT STATEMENT:**

Huaguan Semiconductor reserves the right to change products and services offered without prior notice. Customers should obtain the latest relevant information before placing orders and verify that such information is current and complete. Huaguan Semiconductor assumes no responsibility or liability for altered documents.

Customers are responsible for complying with safety standards and implementing safety measures when using Huaguan Semiconductor products in system design and end-product manufacturing. You assume full responsibility for: selecting the appropriate Huaguan Semiconductor products for your application; designing, validating, and testing your application; and ensuring that your application complies with applicable standards and all other safety, security, or other requirements. This is to prevent potential risks that may lead to personal injury or property damage.

Huaguan Semiconductor products are not approved for use in life support, military, aerospace, or other high-risk applications. Huaguan products are neither intended nor warranted for use in such systems or equipment. Any failure or malfunction may lead to personal injury or severe property damage. Such applications are deemed "Unsafe Use." Unsafe Use includes, but is not limited to: surgical and medical equipment, nuclear energy control equipment, aircraft or spacecraft instruments, control or operation of vehicle power, braking, or safety systems, traffic signal instruments, all types of safety devices, and any other applications intended to support or sustain life. Huaguan Semiconductor shall not be liable for consequences resulting from Unsafe Use in these fields. Users must independently evaluate and assume all risks. Any issues, liabilities, or losses arising from the use of products beyond their approved applications shall be solely borne by the user. Users may not claim any compensation from Huaguan Semiconductor based on these terms. If any third party claims against Huaguan Semiconductor due to such Unsafe Use, the user shall compensate Huaguan Semiconductor for all resulting damages and liabilities.

Huaguan Semiconductor provides technical and reliability data (including datasheets), design resources (including reference designs), application or other design advice, web tools, safety information, and other resources for its semiconductor products. However, no guarantee is made that these resources are free from defects, and no express or implied warranties are provided. The use of testing and other quality control techniques is limited to Huaguan Semiconductor's quality assurance scope. Not all parameters of each device are tested.

Huaguan Semiconductor's documentation authorizes you to use these resources only for developing applications related to the products described herein. You are not granted rights to any other intellectual property of Huaguan Semiconductor or any third party. Any other reproduction or display of these resources is strictly prohibited. You shall fully indemnify Huaguan Semiconductor and its agents against any claims, damages, costs, losses, and liabilities arising from your use of these resources. Huaguan Semiconductor shall not be held responsible.
