描述

MX66100 系列是 5.5V、2A 的理想二极管，采用 6 引脚 SOT23 封装。为了降低低压大电流电源的压降，该产品采用低内阻 P 通道 MOSFET。该产品具有主动防倒灌功能，Oring 接法可以选择输入电压高的支路，适合电池应用场合。此外，通过 ON 外接信号可控制内部 MOS 管的导通与关断，从而控制输出的有无，可充当开关使用。在 ON 低电平时，静态电流低至 10nA。

与 MX22917 相比，加快了防倒灌速度，防倒灌阈值为 10mV。

特性

♦ 输入电压范围： 1V to 5.5V

♦ 最大连续导通电流：2A

♦ 内阻:

100mΩ @ 5V输入（典型值）

160mΩ @ 1.8V 输入 (典型值)

240mΩ @ 1V 输入 (典型值)

♦ 低待机功耗

导通状态: 5uA典型值

关断状态: 10nA 典型值

♦ 6-Pin SOT23-6

应用

工业系统

可穿戴设备

机顶盒

销售终端

血糖仪

P_{D_MAX}	Power dissipation	0.50W

GENERAL DESCRIPTION

The MX66100 are 5.5V, 2A ideal diodes in a 6 pin SOT23 package. To reduce voltage drop for low voltage and high current rails, the device implements a low resistance P channel MOSFET which reduces the drop out voltage across the device. During shutdown, the device has very low leakage currents, thereby reducing unnecessary leakages for downstream modules during standby. Integrated control logic, driver, charge pump, and output discharge FET eliminates the need for any external components which reduces solution size and bill of materials count.

FEATURES

♦ Input voltage range： 1V to 5.5V

♦ Maximum continuous current：2A

♦ On-resistance:

100mΩ at 5V input voltage（typical）

160mΩ at 1.8V input voltage (typical)

240mΩ at 1V input voltage (typical)

♦ Ultra-low power consumption

On state: 5uA typical

Off state: 10nA typical

♦ 6-Pin SOT23-6

APPLICATIONS

Industrial system

Wearable devices

Set-top box

Sales terminal

Blood glucose meter

Operation description

The MX66100 are 5.5V, 2A ideal diodes in 6 pin SOT23 and SC-70-6 package. To reduce voltage drop for low voltage and high current rails, the device implements a low resistance P channel MOSFET which reduces the drop out voltage across the device. During shutdown, the device has very low leakage currents, thereby reducing unnecessary leakages for downstream modules during standby. Integrated control logic, driver, charge pump, and output discharge FET eliminates the need for any external components which reduces solution size and bill of materials count.

On and off control (only for MX66100T)

The ON pin controls the state of the switch. The ON pin is compatible with standard GPIO logic threshold so it can be used in a wide variety of applications. The MX66100T is enabled when the voltage applied to the ON pin is pulled above V_{IH}.

When power is first applied to VIN, a smart pulldown is used to keep the ON pin from floating until system sequencing is complete. After the ON pin is deliberately driven high, the smart pulldown is disconnected to prevent unnecessary power loss. The next table shows when the ON pin smart pulldown is active.

VON	Pulldown
≤VIL	Connected
≥VIH	Disconnected

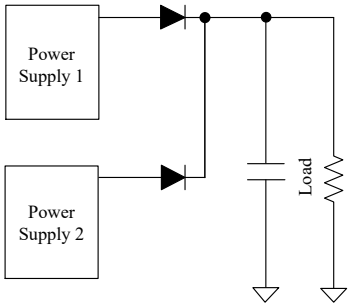
Reverse Current Blocking

The MX66100 initiates reverse current blocking (RCB) when the VOUT voltage is externally biased and exceeds the input voltage supply being used. Once the output voltage is higher than the input voltage of 20mV (I_{RCB}), the device will shut off. Once the voltage difference between the output and input lowers to 40mV (V_{RCB}), the channel will turn back on.

If RCB is expected to occur, it is recommended to clamp the output or use a high output capacitance (about 100μF). This will prevent voltage spikes from damaging the device due to output inductance.

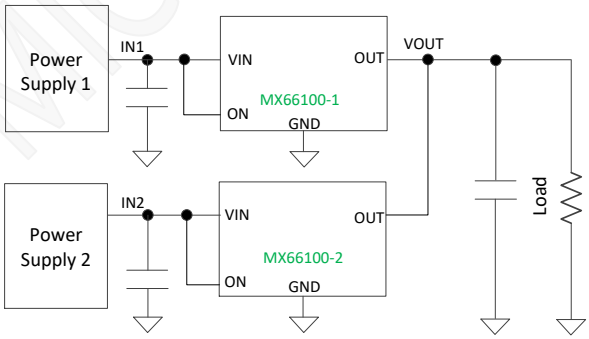
Application Information

Systems that require high availability often use multiple, parallel-connected redundant power supplies to improve reliability. Schottky OR-ing diodes are typically used to connect these redundant power supplies to a common point at the load. The disadvantage of using OR-ing diodes is the forward voltage drop, which reduces the available voltage and the associated power losses as load currents increase.



OR-ing with Diodes

The MX66100 is an OR-ing controller (used on the high-side or positive voltage rail) that replaces an OR-ing diode. When both inputs are applied to the device, the highest voltage is used to power the output.



OR-ing controller

Power supply recommendations

The device is designed to operate with a VIN range of 1V to 5.5V. The VIN power supply must be well regulated and placed as close to the device terminal as possible. The power supply must be able to withstand all transient load current steps. In most situations, using an input capacitance of 1uF is sufficient to prevent the supply voltage from dipping when switch is turned on. In case where the power supply is slow to respond to a large transient current or large load current step, additional bulk capacitance can be required on the input.

Thermal considerations

The maximum IC junction temperature must be restricted to 125℃ under normal operating conditions. To calculate the maximum allowable dissipation, PD(MAX) for a given output current and ambient temperature, use formula:

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

Where

$P_{D(MAX)}$ = maximum allowable power dissipation

$T_{J(MAX)}$ = maximum allowable junction temperature

T_A = ambient temperature of the device

θ_{JA} = junction to air thermal impedance.

Layout guidelines

For best performance, all traces must be as short as possible. To be most effective, the input and output capacitors must be placed as close to the device to minimize the effects that parasitic electrical effects.

Restrictions on Product Use

◆ MAXIN micro is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing MAXIN products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such MAXIN products could cause loss of human life, bodily injury or damage to property.

◆ In developing your designs, please ensure that MAXIN products are used within specified operating ranges as set forth in the most recent MAXIN products specifications.

◆ The information contained herein is subject to change without notice.
