◆ Summary :

LM2596/LM2596HV is a 150KHz fixed frequency PWM DC-DC stabilized power converter. It has 3A output current driving capability, high efficiency, low ripple, high linear adjustment rate, and load adjustment rate. The chip adopts PWM modulation mode to adjust the linear range of duty cycle from 0 to 100%.

LM2596/LM2596HV has a built-in fixed frequency oscillator and frequency compensation module, which is very easy to use and only requires a very small number of external components. In addition, the chip also has built-in functions such as enable with hysteresis, over temperature protection, over-current protection, and stimulation over-current protection. When the secondary overcurrent protection occurs, the chip's built-in frequency down function reduces the operating frequency from 150KHz to 50KHz.

◆ Product features

- Input voltage range 4.5V to 40V, 60V for HV models
- The adjustable version has a range of 1.23V to 37V, and the HV model has 57V
- Adjustable duty cycle range from 0% to 100%
- Minimum saturation voltage drop 1.5V
- 150KHz fixed operating frequency
- 3A fixed current output capability
- ON-OFF hysteresis switch function
- Built in over temperature protection and over-current protection
- Built in frequency compensation function
- High work efficiency, linear adjustment rate, and load adjustment rate

◆ Applications

- LCD display, LCD TV
- Digital photo frame
- TV set-top box
- Modem
- Various telephone and network devices

◆ Pin arrangement diagram

◆ Pin description

Pin number	pin name	I/O	Functional Description
1	V_{IN}	I	Power supply input pin. When working, it is necessary to provide a direct current of 4.5V~40V, HV model 60V range Flow power supply. Connect a capacitor with a larger capacitance in parallel between the power pin and ground to eliminate power noise.
2	OUTPUT	O	Power transistor output pin. The output pin of the power transistor is a switch node that supplies power to the output load.
3	GND	-/O	Grounding pin. Attention should be paid during layout that the pin should be placed outside the output of the Schottky diode Point on the grounding path to prevent noise caused by switch current spikes on the power.
4	FEEDBACK	I/O	Voltage feedback pin. The voltage feedback end monitors the output voltage through a ten thousand resistor voltage divider network And control it. The threshold voltage of the feedback end is 1.23V.
5	ON_OFF	I	Enable switch pin. The switch pin operates the chip by applying a position: applying a high potential to the chip Cut off the film. When it is floating, it defaults to a low potential.

◆ Functional Description

LM2596/LM2596HV is a voltage drop stabilized DC power converter, whose main function is to convert high voltage DC voltage with high noise and ripple into low voltage DC stabilized output with low ripple and noise.

Attention: In application, it is necessary to ensure that the negative pressure of the OUT pin is higher than the turn-on voltage of the parasitic diode inside the chip to avoid negative pressure of the output pin, which may cause the internal parasitic diode to be turned on and increase the power consumption of the internal pre driver module. Therefore, it is recommended to use Schottky diodes in the table, which are diodes with $v_f < 0.5V$
