SRBP-80A2P0

Non-Isolated DC-DC Converter

The SRBP-80A2P0 is a 2-phase non-isolated step-down digital DC/DC converter providing up to 80 A of output current.

All operating features can be configured through Power Management bus. The output voltage range is from 0.6 VDC to 5.2 VDC over a wide range of input voltage from 7.5 VDC to 14 VDC.

The module is provided in a quite small dimension SMD package of

(L x W x H): 1 x 0.5 x 0.48 [inch] / 25.4 x 12.7 x12.2 [mm].

Key Features & Benefits

- 7.5 – 14 VDC Input / 0.6 - 5.2 VDC @ 80 A (single) or 40 A (dual) Output
- Non-isolated Digital DC-DC Converter with Power Management bus
- Two Phase Design, Dual or Single Output Configurable
- High Efficiency
- High Power Density
- Output Over-Voltage Protection
- Over Temperature Protection
- Remote On/Off
- Undervoltage Lockout
- Over Current and Short Circuit Protection
- 2-Wire Remote Sense
- Wide Trim
- Parallelable Up To 8 Phase
- Small Dimension SMD Package
- Class II, Category 2, Non-Isolated DC/DC Converter (refer to IPC-9592B)

RoHS Compliant

Applications

- Networking
- Computers and Peripherals
- Telecommunications

1. MODEL SELECTION

MODEL NUMBER	OUTPUT VOLTAGE	INPUT VOLTAGE	MAX. OUTPUT CURRENT	MAX. OUTPUT POWER	TYPICAL EFFICIENCY
SRPB-80A2P0	0.6 – 5.2 V	7.5 - 14 V	80 A	200 W	90% (11Vin,1.0V/80Aout)

NOTE: Add "G" suffix at the end of the model number to indicate Tray Packaging.
Add "R" suffix to indicate Tape & Reel package.

PART NUMBER EXPLANATION

S	R	BP	-	80	A	2P	0	x
Mounting Type	RoHS Status	Series Name		Output Current	Input Range	Output Voltage	Active Logic	Package Type
SMD	RoHS	POL		80A	7.5 – 14 V	0.6 – 5.2 V	Active High	G – Tray package R – T&R package

2. ABSOLUTE MAXIMUM RATINGS

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNITS
Continuous non-operating Input Voltage		-0.3	-	15	V
Output Voltage		0.6	-	5.2	V
SHARE, EN1, EN2, PG1, PG2, ADDR, SCL, SDA, SALERT, SYNC, CFG, ASCR, Vtrim1, Vtrim2, Terminal Voltage		-0.3	-	5.5	V
VS0+, VS0-, VS1+, VS1-,		-0.3	-	6.0	V
Ambient Temperature		-40	-	85	°C
Storage Temperature		-40	-	125	°C
Altitude		-	-	3000	m

NOTE: Ratings used beyond the maximum ratings may cause a reliability degradation of the converter or may permanently damage the device.

3. INPUT SPECIFICATIONS

All specifications are typical at 25°C unless otherwise state

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNITS
Operating Input Voltage	Vout=0.6 - 3.3 V	7.5	11	14	V
Input Current	Vin = 7.5 V, Vout = 3.3 V Iout = 60 A, Fsw = 457 kHz, Tamb = 55°C, 200 LFM	-	-	33	A

ENABLE					
Signal Low	ENABLE pin open, unit on default.	-0.3	-	0.8	V
Signal High		2	-	5	V

Enable

The enable pins (EN1 and EN2) are used to enable and disable Vo1 and Vo2 separately. When working in Single Output Mode, use only EN1 and ground EN2.

The Enable pins should be held LOW whenever a configuration file, or script is used to configure the module, or a Power Management Bus command is sent to prevent potential damage to application circuit. When the module is used in a self-enabled mode, for example, when EN1 or EN2 is tied to an external 5V, or to a resistor divider to VIN, the user must consider the module's default factory settings. When a configuration file is used to configure the module, the factory default settings are restored to both the user and default stores in order to set the module to an initialized state. Since the default state of the module is to be enabled when the enable pin is high, it is possible for the module to be enabled while the Power Management bus commands are sent to the module during the configuration process.

The Enable pin is edge triggered to achieve fast turn-off times. As a result, minimum Enable high and Enable low pulse widths must be observed to ensure correct operation. The minimum high and low pulse widths are dependent on the configured rise, fall and delay times and can be calculated:

EN low >TOFF_DELAY + TOFF_FALL + 10.5ms

EN high >TON_DELAY + TON_RISE + POWER_GOOD_DELAY + 5.5ms

EN low and EN high times shorter than these minimums may result in the module not responding to the trailing edge of the pulse. For example, a EN low pulse below the EN low minimum pulse width may stay in the OFF state until a valid EN low pulse is applied to the EN pin.

11. OVER TEMPERATURE PROTECTION

Once the module has been disabled due to over temperature fault, the unit will auto recovery once temperature is below OT_WARN_LIMIT +110°C.

The OTP limit, hysteresis and response are configured using the Power Management bus commands OT_FAULT_LIMIT, OT_WARN_LIMIT and OT_FAULT_RESPONSE.

12. OVER CURRENT PROTECTION

Hiccup: To provide protection in output overload condition, the module is equipped with internal current-limiting circuitry which can endure current limiting for a few milliseconds. If the overcurrent condition persists beyond a few milliseconds, the module will shut down then goes into hiccup mode and restart every 280 ms. The module operates normally when the output current goes into specified range. The typical average output current is 4 A during hiccup.

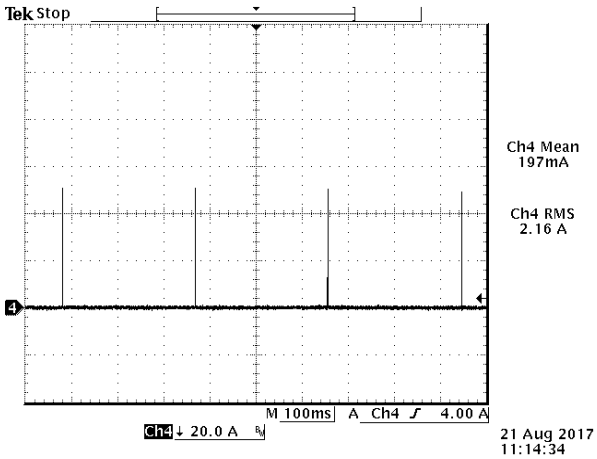

Figure 30. Vout2,
Output current @ SCP, Vin = 11V, Vout = 3.3V, Ta=25 °C

13. INPUT UNDER-VOLTAGE LOCKOUT

The input undervoltage lockout (UVLO) prevents the module from operating when the input falls below a preset threshold. The default UVLO value is 6.7V. The input voltage undervoltage lock-out threshold can be set between 2.85V and 16V using the VIN_UV_FAULT_LIMIT command.

The default response from an undervoltage fault is shut down and stay off until the fault has cleared, and the module has been disabled and re-enabled.

When controlling the module exclusively through the Power Management bus, a high voltage setting for UVLO can be used to prevent the module from being enabled until a lower voltage for UVLO is set using the VIN_UV_FAULT_LIMIT command.

15. POWER GOOD

The module provides power good (PG1, PG2) for each output that indicates the output voltage is within a specified tolerance of its target level and no-fault condition exists. By default, the PG pin will assert if the output is within 10% of the target voltage. These limits and the polarity of the pin may be changed using power management bus commands.

A PG delay period is defined as the time from when all conditions within the module for asserting PG are met to when the PG pin is asserted. This feature is commonly used instead of using an external reset controller to control external digital logic. By default, the module PG delay is set equal to 1ms. The PG delay may be set using a Power Management bus command as described in "POWER_GOOD_DELAY (D4h)".

17. TRIM/OUTPUT VOLTAGE ADJUSTMENT

The output voltage is adjustable from 0.6V to 5.0 V. The outputs can be adjusted with an external resistor placed between the "Vtrim1 or Vtrim2" and "GND". Vo1 and Vo2 can also be set by Power Management bus command. VOUT_MAX is also determined by this pin-strap setting, and is 15% greater than the Vtrim0 and Vtrim1 voltage settings by default, however VOUT_MAX can be changed via the Power Management bus.

Trim Resistor

RTrim (kΩ)	VOUT (V)	RTrim (kΩ)	VOUT (V)
LOW	1	38.3	1.3
OPEN	1.2	42.2	1.4
HIGH	0.9	46.4	1.5

28.7	1.15	147	3.3
31.6	1.2	162	4
34.8	1.25	178	5

18. CHARGE MODE CONTROL SETTING (ASCR)

The device's Charge-Mode response can be optimized by adjusting the ASCR gain and residual settings, either by resister between ASCR and GND, or by using the ASCR_CONFIG Power Management Bus command.

Charge Mode Setting Resistor (RASCR)

RASCR(kΩ)	Vo1 GAIN	Vo2 GAIN	RASCR(kΩ)	Vo1 GAIN	Vo2 GAIN
10	200	200	51.1	800	600

46.4	800	400	HIGH	700	700

19. CONFIGURATION SETTING (CFG)

The Configuration pin (CFG) sets several module configuration settings allowing the module to be used in applications without the need for loading configuration files. When using the module in a 4-phase application, the master module address must be 1 higher than the slave address. This must be done in order for the 2 modules to be recognized as part of a current sharing group. See Power Management bus command “DDC_CONFIG (D3h)” for details.

Configuration Setting Resistor (RCFG)

RCFG(kΩ)	Vo1 AVERAGE OC LIMIT (A)	Vo1 PEAK OC LIMIT (A)	Vo2 AVERAGE OC LIMIT (A)	Vo2 PEAK OC LIMIT (A)	MODE

20. SWITCHING FREQUENCY SETTING (SYNC)

The module switching frequency can be set from 400kHz to 800kHz by connect a RSNYC to SGND or using the Power Management bus command REQUENCY_SWITCH. Switching frequency of 457kHz is recommended.

The module can be driven by an external clock source connected to the SYNC pin. When using the internal oscillator, the SYNC pin can be configured as a clock source. By default, the SYNC pin is configured as an input. The module will automatically check for a clock signal on the SYNC pin each time ON/OFF is asserted. The module will then synchronize with the rising edge of the external clock.

The incoming clock signal must be in the range of 400kHz to 800kHz and must be stable when the ON/OFF pin (ON/OFF0, ON/OFF1) is asserted. When using an external clock, the frequencies are not limited to discrete values as when using the internal clock. The external clock signal must not vary more than 10% from its initial value, and should have a minimum pulse width of 150ns. In the event of a loss of the external clock signal, the output voltage may show transient over shoot or undershoot. If loss of synchronization occurs, the module will automatically switch to its internal oscillator and switch at its programmed frequency.

The SYNC pin can also be configured as an output. The module will run from its internal oscillator and will drive the SYNC pin so other modules can be synchronized to it. The SYNC pin will not be checked for an incoming clock signal while in this mode. The switching frequency can be set to any value between 400kHz to 800kHz using a Power Management bus command. The available frequencies below 800kHz are defined by fSW = 16MHz/N, where $20 \leqslant N \leqslant 40$.

If a value other than fSW = 16MHz/N is entered using a Power Management bus command, the internal circuitry will select the switching frequency value using N as a whole number to achieve a value close to the entered value. For example, if 810kHz is entered, the module will select 800kHz (N=20).

Resistor for switching frequency setting

RSYNC(kΩ)	FREQ(kHz)	RSYNC(kΩ)	FREQ(kHz)
OPEN	400	28.7	571
HIGH	485	31.6	615
21.5	432	34.8	727
23.7	457	38.3	800
26.1	533		

21. CURRENT SHARING (SHARE)

By connecting the SHARE and SYNC pins of each module and configuring the modules as a current sharing rail, the modules will share the current equally. Current sensing element tolerances should be taken into account, or adjusted for using the IOUT_CAL_GAIN and IOUT_CAL_OFFSET commands when necessary. Up to 4 modules can be configured in a given current sharing group.

22. POWER MANAGEMENT BUS ADDRESS SELECTION (SA)

When communicating with multiple Power Management bus modules using the Power Management bus interface, each module must have its own unique address so the host can distinguish between the module. The module address can be set by a resistor from pin ADDR to SGND. When operating in 2-channel mode, care must be taken when using sequential Power Management bus addresses. Since DDC(SHARE) addresses are automatically set using the Power Management bus address, it is possible for a module with a Power Management bus address immediately after a 2-channel module to be automatically configured with the same DDC address as one of the module channels, which could cause unintended operating modes. For this reason, do not use the next higher Power Management bus address when using the module as a 2-channel module. See Power Management bus command “DDC_CONFIG (D3h)” for details. The Power Management bus address cannot be changed with a Power Management bus command.

Power Management Bus Address (RADDR)

23. POWER MANAGEMENT BUS COMMAND SUMMARY

CODE	COMMAND NAME	DESCRIPTION	TYPE	DATA FORMAT	DEFAULT VALUE	DEFAULT SETTING
00h	PAGE	Selects Controller 0, 1, or both	R/W	BIT	00h	Page 0 Controller addressed
01h	OPERATION	Enable/disable, margin settings	R/W	BIT	00h	Immediate off, nominal margin
02h	ON_OFF_CONFIG	On/off configuration settings	R/W	BIT	17h	ENABLE pin control, active high
03h	CLEAR_FAULTS	Clears faults	Write	N/A	N/A	N/A
11h	STORE_DEFAULT_ALL	Stores values to default store	Write	N/A	N/A	N/A
12h	RESTORE_DEFAULT_ALL	Restores values from default store	Write	N/A	N/A	N/A
15h	STORE_USER_ALL	Stores values to user store	Write	N/A	N/A	N/A
16h	RESTORE_USER_ALL	Restores values from user store	Write	N/A	N/A	N/A
20h	VOUT_MODE	Reports VOUT mode and exponent	Read	BIT	13h	Linear mode, exponent = -13
21h	VOUT_COMMAND	Sets nominal VOUT set-point	R/W	L16u	N/A	Pin-strap setting
22h	VOUT_TRIM	Applies offset voltage to VOUT set-point	R/W	L16s	0000h	0V
23h	VOUT_CAL_OFFSET	Applies offset voltage to VOUT set-point	R/W	L16s	0000h	0V
24h	VOUT_MAX	Sets maximum VOUT set-point	R/W	L16u	N/A	1.15 x VSET pin-strap setting
25h	VOUT_MARGIN_HIGH	Sets VOUT set-point during margin high	R/W	L16u	N/A	1.05 x VSET pin-strap setting
26h	VOUT_MARGIN_LOW	Sets VOUT set-point during margin low	R/W	L16u	N/A	0.95 x VSET pin-strap setting
27h	VOUT_TRANSITION_RATE	Sets VOUT transition rate during margin commands	R/W	L11	BA00h	1V/ms
28h	VOUT_DROOP	Sets V/I slope for total rail output current (all phases combined)	R/W	L11	N/A	CFG pin-strap setting
33h	FREQUENCY_SWITCH	Sets switching frequency	R/W	L11	N/A	SYNC pin-strap setting
37h	INTERLEAVE	Configures phase offset during group operation	R/W	BIT	N/A	CFG pin-strap setting
38h	IOUT_CAL_GAIN	Sets impedance of current sense circuit	R/W	L11	B3CCh	0.95mV/A,
39h	IOUT_CAL_OFFSET	Sets an offset to IOUT sense circuit	R/W	L11	BD00h	-1.5A
40h	VOUT_OV_FAULT_LIMIT	Sets the VOUT overvoltage fault threshold	R/W	L16u	N/A	1.10 x VSET pin-strap setting
41h	VOUT_OV_FAULT_RESPONSE	Sets the VOUT overvoltage fault response	R/W	BIT	80h	Disable, no retry
44h	VOUT_UV_FAULT_LIMIT	Sets the VOUT undervoltage fault threshold	R/W	L16u	N/A	0.85 x VSET pin-strap setting
45h	VOUT_UV_FAULT_RESPONSE	Sets the VOUT undervoltage fault response	R/W	BIT	80h	Disable, no retry
46h	IOUT_OC_FAULT_LIMIT	Sets the IOUT peak overcurrent fault threshold for each phase	R/W	L11	N/A	CFG pin-strap setting
4Bh	IOUT_UC_FAULT_LIMIT	Sets the IOUT valley undercurrent fault threshold for each phase	R/W	L11	N/A	-1*IOUT_OC_FAULT_LIMIT from CFG pin-strap setting
4Fh	OT_FAULT_LIMIT	Sets the over-temperature fault limit	R/W	L11	EBE8h	+125°C
50h	OT_FAULT_RESPONSE	Sets the over-temperature fault response	R/W	BIT	FFh	Continuous retry, 280ms retry delay
51h	OT_WARN_LIMIT	Sets the over-temperature warning limit	R/W	L11	EB70h	+110°C
52h	UT_WARN_LIMIT	Sets the under-temperature warning limit	R/W	L11	E580h	-40°C
53h	UT_FAULT_LIMIT	Sets the under-temperature fault limit	R/W	L11	E440h	-60°C
54h	UT_FAULT_RESPONSE	Sets the under-temperature fault response	R/W	BIT	FFh	Continuous retry, 280ms retry delay
55h	VIN_OV_FAULT_LIMIT	Sets the VIN overvoltage fault threshold	R/W	L11	D3C0h	15V

56h	VIN_OV_FAULT_RESPONSE	Sets the VIN overvoltage fault response	R/W	BIT	80h	Disable, no retry
57h	VIN_OV_WARN_LIMIT	Sets the VIN overvoltage warning threshold	R/W	L11	D360h	13.5V
58h	VIN_UV_WARN_LIMIT	Sets the VIN undervoltage warning threshold	R/W	L11	N/A	1.1 x UVLO pin-strap setting
59h	VIN_UV_FAULT_LIMIT	Sets the VIN undervoltage fault threshold	R/W	L11	N/A	UVLO pin-strap setting
5Ah	VIN_UV_FAULT_RESPONSE	Sets the VIN undervoltage fault response	R/W	BIT	BFh	Continuous retries, 280ms retry delay
5Eh	POWER_GOOD_ON	Sets the voltage threshold for power-good indication	R/W	L16u	N/A	0.9 x VSET pin-strap setting
60h	TON_DELAY	Sets the delay time from enable to VOUT rise	R/W	L11	CA80h	5ms
61h	TON_RISE	Sets the rise time of VOUT after ENABLE and TON_DELAY	R/W	L11	CA80h	5ms
64h	TOFF_DELAY	Sets the delay time from DISABLE to start of VOUT fall	R/W	L11	CA80h	5ms
65h	TOFF_FALL	Sets the fall time for VOUT after DISABLE and TOFF_DELAY	R/W	L11	CA80h	5ms
78h	STATUS_BYTE	First byte of STATUS_WORD	Read	BIT	00h	No faults
79h	STATUS_WORD	Summary of critical faults	Read	BIT	0000h	No faults
7Ah	STATUS_VOUT	Reports VOUT warnings/faults	Read	BIT	00h	No faults
7Bh	STATUS_IOUT	Reports IOUT warnings/faults	Read	BIT	00h	No faults
7Ch	STATUS_INPUT	Reports input warnings/faults	Read	BIT	00h	No faults
7Dh	STATUS_TEMP	Reports temperature warnings/faults	Read	BIT	00h	No faults
7Eh	STATUS_CML	Reports communication, memory, logic errors	Read	BIT	00h	No faults
80h	STATUS_MFR_SPECIFIC	Reports voltage monitoring/clock synchronization faults	Read	BIT	00h	no faults
88h	READ_VIN	Reports input voltage measurement	Read	L11	N/A	N/A
89h	READ_IIN	Reports input current measurement	Read	L11	N/A	N/A
8Bh	READ_VOUT	Reports output voltage measurement	Read	L16u	N/A	N/A
8Ch	READ_IOUT	Reports output current measurement	Read	L11	N/A	N/A
8Dh	READ_TEMPERATURE_1	Reports internal temperature measurement	Read	L11	N/A	N/A
8Eh	READ_TEMPERATURE_2	Reports external temperature measurement from XTEMP pins	Read	L11	N/A	N/A
8Fh	READ_TEMPERATURE_3	Reports external temperature measurement from VMON/TMON pin.	Read	L11	N/A	N/A
94h	READ_DUTY_CYCLE	Reports actual duty cycle	Read	L11	N/A	N/A
95h	READ_FREQUENCY	Reports actual switching frequency	Read	L11	N/A	N/A
98h	POWER MANAGEMENT BUS_REVISION	Reports the POWER MANAGEMENT BUS revision used	Read	BIT	22h	P1 R1.2, P2 R1.2
99h	MFR_ID	Sets a user defined identification	R/W	ASC	N/A	<null>
9Ah	MFR_MODEL	Sets a user defined model	R/W	ASC	N/A	<null>
9Bh	MFR_REVISION	Sets a user defined revision	R/W	ASC	N/A	<null>
9Ch	MFR_LOCATION	Sets a user defined location identifier	R/W	ASC	N/A	<null>
9Dh	MFR_DATE	Sets a user defined date	R/W	ASC	N/A	<null>
9Eh	MFR_SERIAL	Sets a user defined serialized identifier	R/W	ASC	N/A	<null>
ADh	IC_DEVICE_ID	Reports device identification information	Read	CUS	49A02D00h	Intersil MODULE
AEh	IC_DEVICE_REV	Reports device revision information	Read	CUS	01000000h	Initial Release
B0h	USER_DATA_00	Sets user defined data	R/W	ASC	N/A	<null>
CEh	MIN_VOUT_REG	Sets a minimum start-up voltage	R/W	L11	0000h	0mV
D0h	ISENSE_CONFIG	Configures current sensing circuitry	R/W	BIT	620Eh	Downslope, 5 fault count, 384ns blanking, high range
D1h	USER_CONFIG	Configures several user-level features	R/W	BIT	N/A	Set by CFG pin-strap setting
D2h	IIN_CAL_GAIN	Sets the resistance of the input current sensing resistor	R/W	L11	C200h	2mfi

© 2021 Bel Power Solutions & Protection

D3h	DDC_CONFIG	Configures the DDC addressing and current sharing	R/W	BIT	N/A	Set by pin-strapped Power Management bus address and CFG pin-strap setting
D4h	POWER_GOOD_DELAY	Sets the delay between PG threshold and PG assertion	R/W	L11	BA00h	1ms
D5h	MULTI_PHASE_RAMP_GAIN	Adjusts the ramp-up and ramp-down rate by setting the feedback gain	R/W	CUS	03h	3
D6h	INDUCTOR	Sets the inductor value	R/W	L11	B133h	0.3µH
D7h	SNAPSHOT_FAULT_MASK	Masks faults that cause a snapshot to be taken	R/W	BIT	0000h	No faults masked
D8h	OVUV_CONFIG	Configures output voltage OV/UV fault detection	R/W	BIT	00h	Low side FET off on fault, 1 violation triggers fault.
D9h	XTEMP_SCALE	Calibrates external temperature sensor	R/W	L11	BA00h	1/degree C
DAh	XTEMP_OFFSET	Offset calibration for external temperature sensor	R/W	L11	0000h	No offset
DBh	MFR_SMBALERT_MASK	Identifies which fault limits will not assert SALRT	R/W	Custom	00..00h	N/A
DCh	TEMPCO_CONFIG	Sets tempco settings	R/W	BIT	00h	0ppm/°C
DDh	PINSTRAP_READ_STATUS	Reads pin-strap settings	Read	BIT	N/A	Set by pin-straps
DFh	ASCR_CONFIG	Configures the ASCR settings	R/W	BIT	N/A	ASCRCFG pin-strap setting
E0h	SEQUENCE	DDC rail sequencing configuration	R/W	BIT	00h	Prequel and sequel disabled
E1h	TRACK_CONFIG	Configures voltage tracking.	R/W	BIT	00h	Tracking disabled
E2h	DDC_GROUP	Configures group ID, fault spreading, OPERATION and VOUT	R/W	BIT	N/A	Set by CFG pin-strap
E4h	DEVICE_ID	Returns the device identifier string	Read	ASC	TBD	MODULE, current revisions
E5h	MFR_IOUT_OC_FAULT_RESPONSE	Configures the IOUT overcurrent fault response	R/W	BIT	BFh	Continuous retries, 280ms retry delay
E6h	MFR_IOUT_UC_FAULT_RESPONSE	Configures the IOUT undercurrent fault response	R/W	BIT	BFh	Continuous retries, 280ms retry delay
E7h	IOUT_AVG_OC_FAULT_LIMIT	Sets the IOUT average overcurrent fault threshold	R/W	L11	N/A	Set by CFG pin-strap
E8h	IOUT_AVG_UC_FAULT_LIMIT	Sets the IOUT average undercurrent fault threshold	R/W	L11	N/A	-1* IOUT_AVG_OC_FAULT_LIMIT
E9h	USER_GLOBAL_CONFIG	Sets options pertaining to advanced features	R/W	BIT	N/A	Set by CFG pin-strap setting
EAh	SNAPSHOT	32-byte read-back of parametric and status values	Read	BIT	N/A	<null>
F0h	LEGACY_FAULT_GROUP	Configures fault group compatibility with older Intersil digital power devices	R/W	BIT	00000000h	<null>
F3h	SNAPSHOT_CONTROL	Snapshot feature control command	R/W	BIT	00h	N/A
F4h	RESTORE_FACTORY	Restores device to the hard-coded default values	Write	N/A	N/A	N/A
F5h	MFR_VMON_OV_FAULT_LIMIT	Sets the VMON overvoltage fault threshold	R/W	L11	C266h	2.4V, SPS OT trip voltage
F6h	MFR_VMON_UV_FAULT_LIMIT	Sets the VMON undervoltage fault threshold	R/W	L11	A333h	0.2V
F7h	MFR_READ_VMON	Reads the VMON voltage	Read	L11	N/A	N/A
F8h	VMON_OV_FAULT_RESPONSE	Configures the VMON overvoltage fault response	R/W	BIT	BFh	Continuous retry
F9h	VMON_UV_FAULT_RESPONSE	Configures the VMON undervoltage fault response	R/W	BIT	BFh	Continuous retry
FAh	SECURITY_LEVEL	Reports the security level	Read	Hex	01h	Public security level
FBh	PRIVATE_PASSWORD	Sets the private password string	R/W	ASC	00…00h	<null>
FCh	PUBLIC_PASSWORD	Sets the public password string	R/W	ASC	00…00h	<null>
FDh	UNPROTECT	Identifies which commands are protected	R/W	Custom	FF…FFh	No commands are protected

24. POWER MANAGEMENT BUS USE GUIDELINES

The Power Management bus is a powerful tool that allows the user to optimize circuit performance by configuring the MODULE for their application. When configuring the MODULE in a circuit, the MODULE should be disabled whenever most settings are changed with Power Management bus commands. Some exceptions to this recommendation are OPERATION, ON_OFF_CONFIG, CLEAR_FAULTS, VOUT_COMMAND, VOUT_MARGIN_HIGH, VOUT_MARGIN_LOW and ASCCR_CONFIG. While the device is enabled any command can be read. Many commands do not take effect until after the device has been reenabled, hence the recommendation that commands that change device settings are written while the device is disabled.

When sending the STORE_DEFAULT_ALL, STORE_USER_ALL, RESTORE_DEFAULT_ALL and RESTORE_USER_ALL commands, it is recommended that no other commands are sent to the device for 100ms after sending STORE or RESTORE commands.

In addition, there should be a 2ms delay between repeated READ commands sent to the same device. When sending any other command, a 5ms delay is recommended between repeated commands sent to the same device.

25. SUMMARY

All commands can be read at any time.

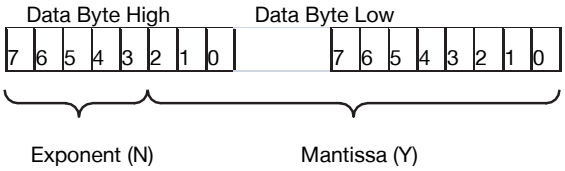
Always disable the MODULE when writing commands that change device settings. Exceptions to this rule are commands intended to be written while the device is enabled, for example, VOUT_MARGIN_HIGH.

To be sure a change to a device setting has taken effect, write the STORE_USER_ALL command, then cycle input power and reenable the device.

26. POWER MANAGEMENT BUS DATA FORMATS

Linear-11 (L11)

L11 data format uses 5-bit two's compliment exponent (N) and 11-bit two's compliment mantissa (Y) to represent real world decimal value (X).



Relation between real world decimal value (X), N and Y is: $X = Y \cdot 2^{N}$

Linear-16 Unsigned (L16u)

L16u data format uses a fixed exponent (hard-coded to N = -13h) and a 16-bit unsigned integer mantissa (Y) to represent real world decimal value (X). Relation between real world decimal value (X), N and Y is: $X = Y \cdot 2^{-13}$

Linear-16 Signed (L16s)

L16s data format uses a fixed exponent (hard-coded to N = -13h) and a 16-bit two's compliment mantissa (Y) to represent real world decimal value (X).

Relation between real world decimal value (X), N and Y is: $X = Y \cdot 2^{-13}$

Bit Field (BIT)

Breakdown of Bit Field is provided in "Power Management bus Command Detail".

© 2021 Bel Power Solutions & Protection

Custom (CUS)

Breakdown of Custom data format is provided in "Power Management bus Command Detail". A combination of Bit Field and integer are common type of Custom data format.

ASCII (ASC)

A variable length string of text characters uses ASCII data format

27. POWER MANAGEMENT BUS COMMAND DETAIL

PAGE (00h)

Definition: Selects Controller 0, Controller 1 or both Controllers 0 and 1 to receive commands. All commands following this command will be received and acted on by the selected controller or controllers.

Data Length in Bytes: 1

Data Format: Bit Field

OPERATION (01h)

Definition: Sets Enable, Disable and VOUT Margin settings. This command can also be monitored to read the operating state of the device on bits 7:6. Writing Immediate off will turn off the output and ignore TOFF_DELAY and TOFF_FALL settings. This command is not stored like other Power Management bus commands. The value read reflects the current state of the device. When this command is written the command takes effect, but if a STORE _USER_ALL written and the device is reenabled, the OPERATION settings may not be the same settings that were written before the device was reenabled.

Paged or Global: Paged

Data Length in Bytes: 1

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: 00h (immediate off)

Units: N/A

COMMAND	OPERATION (01h)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

BITS 7:6	BITS 5:4	BITS 3:0 (NOT USED)	UNIT ON OR OFF	MARGIN STATE
0	0	0	Immediate off (No sequencing)	N/A
1	0	0	Soft off (With sequencing)	N/A
10	0	0	On	Nominal
10	1	0	On	Margin Low
10	10	0	On	Margin High

NOTE: Bit combinations not listed above may cause command errors.

ON_OFF_CONFIG (02h)

Definition: Configures the interpretation and coordination of the OPERATION command and the ENABLE pin (EN). When bit 0 is set to 1 (turn off the output immediately), the TOFF_FALL setting is ignored.

Paged or Global: Paged

Data Length in Bytes: 1

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: 17h (ENABLE pin control, active high, turn off output immediately – no ramp down)

Units: N/A

COMMAND	ON_OFF_CONFIG (02h)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	See Following Table							
Default Value	0	0	0	1	0	1	1	1

BIT NUMBER	PURPOSE	BIT VALUE	MEANING
7:5	Not Used	000	Not used
4:2	Sets the default to either operate any time power is present or for the on/off to be controlled by ENABLE pin or OPERATION command	000	Not used
		101	Device starts from ENABLE pin only.
		110	Device starts from OPERATION command only.
1	(Polarity of ENABLE pin - not used)	1	Active high only.
0	ENABLE pin action when commanding the unit to turn off	0	Use the configured ramp-down settings (“soft-off”)
		1	Turn off the output immediately.

CLEAR_FAULTS (03h)

Definition: Clears all fault bits in all registers and releases the SALRT pin (if asserted) simultaneously. If a fault condition still exists, the bit will reassert immediately. This command will not restart a device if it has shut down, it will only clear the faults.

Paged or Global: Global

Data Length in Bytes: 0 Byte

Data Format: N/A

Type: Write only

Protectable: Yes

Default Value: N/A

Units: N/A

STORE_DEFAULT_ALL (11h)

Definition: Stores all current Power Management bus values from the operating memory into the nonvolatile DEFAULT Store memory. To clear the DEFAULT store, perform a RESTORE_FACTORY then STORE_DEFAULT_ALL. To add to the DEFAULT store, perform a RESTORE_DEFAULT_ALL, write commands to be added, then STORE_DEFAULT_ALL. This command should not be used during device operation, the device will be unresponsive for 100ms while storing values.

Paged or Global: Global

Data Length in Bytes: 0

Data Format: N/A

Type: Write only

Default Value: N/A

Units: N/A

© 2021 Bel Power Solutions & Protection

RESTORE_DEFAULT_ALL (12h)

Definition: Restores Power Management bus settings from the nonvolatile DEFAULT store memory into the operating memory. These settings are loaded during at power-up if not superseded by settings in USER store. Security level is changed to level 1 following this command. This command should not be used during device operation, the device will be unresponsive for 100ms while storing values.

Paged or Global: Global

Data Length in Bytes: 0

Data Format: N/A

Type: Write only

Default Value: N/A

Units: N/A

STORE_USER_ALL (15h)

Definition: Stores all Power Management bus settings from the operating memory to the nonvolatile USER store memory. To clear the USER store, perform a RESTORE_FACTORY then STORE_USER_ALL. To add to the USER store, perform a RESTORE_USER_ALL, write commands to be added, then STORE_USER_ALL. This command should not be used during device operation, the device will be unresponsive for 100ms while storing values.

Paged or Global: Global

Data Length in Bytes: 0

Data Format: N/A

Type: Write only

Default Value: N/A

Units: N/A

RESTORE_USER_ALL (16h)

Definition: Restores all Power Management bus settings from the USER store memory to the operating memory. Command performed at power-up. Security level is changed to Level 1 following this command. This command should not be used during device operation, the device will be unresponsive for 100ms while restoring values.

Paged or Global: Global

Data Length in Bytes: 0

Data Format: N/A

Type: Write only

Default Value: N/A

Units: N/A

VOUT_MODE (20H)

Definition: Reports the VOUT mode and provides the exponent used in calculating several VOUT settings.

Data Length in Bytes: 1

Data Format: BIT

Type: Read Only

Default Value: 13h (Linear Mode, Exponent = -13)

Units: N/A

COMMAND	VOUT_MODE (20h)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R
Function	See Following Table							
Default Value	0	0	0	1	0	0	1	1

MODE	BITS 7:5	BITS 4:0 (PARAMETER)
Linear	000	5-bit two's complement exponent for the mantissa delivered as the data bytes for an output voltage related command.

VOUT_COMMAND (21h)

Definition: This command sets or reports the target output voltage. The integer value is multiplied by 2 raised to the power of -13h. This command cannot be set to be higher than 115% of the pin-strap VSET setting, or VOUT_MAX if VOUT_MAX is set higher than 115% of the pin-strap VSET setting.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear -16 Unsigned

Type: R/W

Protectable: Yes

Default Value: VSET pin-strap setting

Units: Volts

Equation: VOUT = VOUT_COMMAND × 2-13

Range: 0 to VOUT_MAX

Example: VOUT_COMMAND = 699Ah = 27,034

Target voltage equals 27034 × 2-13 = 3.3V

COMMAND	VOUT_COMMAND (21h)															
Format	Linear-16 Unsigned															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default Value	VSET Pin-strap Setting

VOUT_TRIM (22h)

Definition: The VOUT_TRIM command is used to apply a fixed trim voltage to the output voltage command value. This command is typically used by the manufacturer of a power supply subassembly to calibrate a device in the subassembly circuit. The two bytes are formatted as a two's complement binary mantissa, used in conjunction with the exponent of -13h.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear -16 Signed

Type: R/W

Protectable: Yes

Default Value: 0000h

Units: Volts

Equation: VOUT trim = VOUT_TRIM× 2-13

Range: ±150mV

COMMAND	VOUT_TRIM (22h)															
Format	Linear-16 Signed															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

VOUT_CAL_OFFSET (23h)

Definition: The VOUT_CAL_OFFSET command is used to apply a fixed offset voltage to the output voltage command value. This command is typically used by the user to calibrate a device in the application circuit. The two bytes are formatted as a two's complement binary mantissa, used in conjunction with the exponent of -13h.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear -16 Signed

Type: R/W

Protectable: Yes

Default Value: 0000h

Units: Volts

Equation: VOUT calibration offset = VOUT_CAL_OFFSET×2-13

Range: ±150mVV

COMMAND	VOUT_CAL_OFFSET (23h)															
Format	Linear-16 Signed															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

VOUT_MAX (24h)

Definition: The VOUT_ MAX command sets an upper limit on the output voltage the unit can command regardless of any other commands or combinations. The intent of this command is to provide a safeguard against a user accidentally setting the output voltage to a possibly destructive level rather than to be the primary output overprotection. If a VOUT_COMMAND is sent with a value higher than VOUT_MAX, the device will set the output voltage to VOUT_MAX. Note that this command setting does not automatically scale with a stored VOUT_COMMAND setting.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear -16 Unsigned

Type: R/W

Protectable: Yes

Default Value: 1.15 x VSET pin-strap setting

Units: Volts

Equation: VOUT max = VOUT_MAX × 2-13

Range: 0V to 5.5V

COMMAND	VOUT_MAX (24h)															
Format	Linear-16 Unsigned															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default Value	1.15 x VSET Pin-strap Setting															

VOUT_MARGIN_HIGH (25h)

Definition: Sets the value of the VOUT during a margin high. This VOUT_MARGIN_HIGH command loads the unit with the voltage to which the output is to be changed when the OPERATION command is set to “Margin High”.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-16 Unsigned

Type: R/W word

Protectable: Yes

Default Value: 1.05 x VSET pin-strap setting.

Units: V

Equation: VOUT margin high = VOUT_MARGIN_HIGH x 2-13

Range: 0V to VOUT_MAX

COMMAND	VOUT_MARGIN_HIGH (25h)															
Format	Linear-16 Unsigned															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default Value	1.05 x VSET Pin-strap Setting															

VOUT_MARGIN_LOW (26h)

Definition: Sets the value of the VOUT during a margin low. This VOUT_MARGIN_LOW command loads the unit with the voltage to which the output is to be changed when the OPERATION command is set to “Margin Low”.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-16 Unsigned.

Type: R/W

Protectable: Yes

Default Value: 0.95 x VSET pin-strap setting.

Units: V

Equation: VOUT margin low = VOUT_MARGIN_LOW

Range: 0V to VOUT_MAX

COMMAND	VOUT_MARGIN_LOW (26h)															
Format	Linear-16 Unsigned															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default Value	0.95 x VSET Pin-strap Setting															

VOUT_TRANSITION_RATE (27h)

Definition: This command sets the rate at which the output should change voltage when the device receives an OPERATION command (Margin High, Margin Low) that causes the output voltage to change. The maximum possible positive value of the two data bytes indicates that the device should make the transition as quickly as possible. This commanded rate does not apply when the device is commanded to turn on or to turn off.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: BA00h (1.0V/ms)

Units: V/ms

Equation: VOUT_TRANSITION_RATE = Y×2N

Range: 0.1 to 4V/ms

COMMAND	VOUT_TRANSITION_RATE (27h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	0	1	1	1	0	1	0	0	0	0	0	0	0	0	0

VOUT_DROOP (28h)

Definition: The VOUT_DROOP sets the effective load line (V/I slope) for the rail in which the device is used. It is the rate, in mV/A at which the output voltage decreases with increasing output current for use with passive current sharing schemes. For devices that are set to sink output current (negative output current), the output voltage continues to increase as the output current is negative.

VOUT_DROOP is not needed with a single (2-phase) ZL8802. VOUT_DROOP is needed when multiple ZL8802s are operated in current sharing mode, i.e., 4-, 6- and 8-phase configurations. In this case, VOUT_DROOP is calculated based on the combined output current of all phases as applicable.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: Set by CFG pin-strap setting

Units: mV/A

Equation: VOUT_DROOP = $Y \times 2^N$

Range: 0 to 40mV/A

COMMAND	VOUT_DROOP (28h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	Set by CFG Pin-strap Setting															

FREQUENCY_SWITCH (33h)

Definition: Sets the switching frequency of the device. Initial default value is defined by a pin-strap and this value can be overridden by writing this command. If an external SYNC is utilized, this value should be set as close as possible to the external clock value. The output must be disabled when writing this command. Available frequencies are defined by the equation fSW = 16MHz/n where

12 S n S 80.

Paged or Global: Global

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: SYNC pin-strap setting

Units: kHz

Equation: FREQUENCY_SWITCH = $Y \times 2^N$

Range: 200kHz-1.33MHz

COMMAND	FREQUENCY_SWITCH (33h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	SYNC Pin-strapped Value															

INTERLEAVE (37h)

Definition: Configures the phase offset of a device that is sharing a common SYNC clock with other devices. A desired phase position is specified. Interleave is used for setting the phase offset between individual devices, current sharing groups, and/or combinations of devices and current sharing groups. For devices within single current sharing group the phase offset is set automatically. In a multiphase current share group the same interleave settings must be stored in all devices in the current sharing group in order to phase spread properly. Interleave Offset refers to the phase offset of Phase 0 of the device; Phase 1 is always Phase 0 + 180 degrees.

INTERLEAVE Phase offset is calculated with Equation:

Phase Offset (in degrees) = Rounded Position • 16 Number • 22.5

Phase offsets greater than 360 degrees are “wrapped around” by subtracting 360 degrees.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: Set by CFG pin-strap setting.

Units: N/A

COMMAND	INTERLEAVE (37h)															
Format	Bit Field															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	See Following Table															
Default Value	Set by CFG Pin-strap Setting															

BITS	PURPOSE	VALUE	DESCRIPTION
15:8	Not Used	0	Not used
7:4	Number In Group	0 to 15d	Sets the number of devices in the interleave group. A value of 0 is interpreted as 16.
3:0	Position in Group (Interleave Order)	0 to 15d	Sets position of the device’s rail within the group. A value of 0 is interpreted as 16. Position 1 will have a 22.5 degree offset.

IOUT_CAL_GAIN (38h)

Definition: Sets the effective impedance across the current sense circuit for use in calculating output current at +25°C.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: B2AEh (0.67mfi)

Units: mfi

Equation: IOUT_CAL_GAIN = $Y \times 2^N$

COMMAND	IOUT_CAL_GAIN (38h)															
Format	Linear-11

Default Value	1.10 x VSET Pin-strap Setting															

VOUT_OV_FAULT_RESPONSE (41h)

Definition: Configures the VOUT overvoltage fault response. The retry time is the time between restart attempts.

Paged or Global: Paged

Data Length in Bytes: 1

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: 80h (shut down immediately, no retries)

Units: Retry time = 35ms increments

COMMAND	VOUT_OV_FAULT_RESPONSE (41h)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	See Following Table							
Default Value	1	0	0	0	0	0	0	0

© 2021 Bel Power Solutions & Protection

BIT	FIELD NAME	VALUE	DESCRIPTION
7:6	Response behavior, the device: • Pulls SALRT low • Sets the related fault bit in the status registers. Fault bits are only cleared by the CLEAR_FAULTS command.	00-01	Not used
		10-11	Disable and retry according to the setting in bits [5:3].
5:3	Retry Setting	000	No retry. The output remains disabled until the device is restarted.
		001-110	Not used
		111	Attempts to restart continuously, until it is commanded OFF (by the ENABLE pin or OPERATION command or both), bias power is removed, or another fault condition causes the unit to shut down. The time between the start of each attempt to restart is set by the value in bits [2:0] multiplied by 35ms.
2:0	Retry Delay	000-111	Retry delay time = (Value +1)*35ms. Sets the time between retries in 35ms increments. Range is 35ms to 280ms.

VOUT_UV_FAULT_LIMIT (44h)

Definition: Sets the VOUT undervoltage fault threshold. This fault is masked during ramp, before power-good is asserted or when the device is disabled. VOUT_UV_FAULT_LIMIT should be set to a value below POWER_GOOD

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-16 Unsigned.

Type: R/W

Protectable: Yes

Default Value: 0.85 x VSET pin-strap setting.

Units: V

Equation: VOUT UV fault limit = VOUT_UV_FAULT_LIMIT$\times 2^{-13}$

Range: 0V to 7.99V

COMMAND	VOUT_UV_FAULT_LIMIT (44h)															
Format	Linear-16 Unsigned

VOUT_UV_FAULT_RESPONSE (45h)

BIT	FIELD NAME	VALUE	DESCRIPTION
7:6	Response Behavior: the device: • Pulls SALRT low • Sets the related fault bit in the status registers. Fault bits are only cleared by the CLEAR_FAULTS command.	00-01	Not used
		10-11	Disable and Retry according to the setting in bits [5:3].
5:3	Retry Setting	000	No retry. The output remains disabled until the fault is cleared.
		001-110	Not used
		111	Attempts to restart continuously, until it is commanded OFF (by the ENABLE pin or OPERATION command or both), bias power is removed, or another fault condition causes the unit to shut down. The time between the start of each attempt to restart is set by the value in bits [2:0] multiplied by 35ms.
2:0	Retry Delay	000-111	Retry delay time = (Value+1)*35ms. Sets the time between retries in 35ms increments. Range is 35ms to 280ms.

IOUT_OC_FAULT_LIMIT (46h)

Definition: Sets the IOUT peak overcurrent fault threshold. This limit is applied to current measurement samples taken after the Current Sense Blanking Time has expired (see "ISENSE_CONFIG (D0h)"). A fault occurs after this limit is exceeded for the number of consecutive samples as defined in ISENSE_CONFIG. This feature shares the OC fault bit operation (in STATUS_IOUT) and OC fault response with IOUT_AVG_OC_FAULT_LIMIT.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: CFG pin-strap setting

Units: A

Equation: IOUT_OC_FAULT_LIMIT = $Y \times 2^N$

Range: -100A to 100A

COMMAND	IOUT_OC_FAULT_LIMIT(46h)															
Format	Linear-11

OT_FAULT_RESPONSE (50h)

BIT	FIELD NAME	VALUE	DESCRIPTION
7:6	Response Behavior: the device: Pulls SALRT low Sets the related fault bit in the status registers. Fault bits are only cleared by the CLEAR_FAULTS command.	00-01	Not used
		10	Disable and Retry according to the setting in bits [5:3].
		11	Output is disabled while the fault is present. Operation resumes and the output is enabled when the temperature falls below the OT_WARN_LIMIT.
5:3	Retry Setting	000	No retry. The output remains disabled until the fault is cleared.
		001-110	Not used
		111	Attempts to restart continuously, until it is commanded OFF (by the ENABLE pin or OPERATION command or both), bias power is removed, or another fault condition causes the unit to shut down. A retry is attempted after the temperature falls below the OT_WARN_LIMIT. The time between the start of each attempt to restart is set by the value in bits [2:0] multiplied by 35ms.
2:0	Retry Delay	000-111	Retry delay time = (Value +1)*35ms. Sets the time between retries in 35ms increments. Range is 35ms to 280ms.

© 2021 Bel Power Solutions & Protection

OT_WARN_LIMIT (51h)

Definition: The OT_WARN_LIMIT command sets the temperature at which the device should indicate an over-temperature warning alarm. In response to the OT_WARN_LIMIT being exceeded, the device: Sets the TEMPERATURE bit in STATUS_WORD, sets the OT_WARNING bit in STATUS_TEMPERATURE and notifies the host.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: EB70h (+110°C)

Units: Celsius

Equation: OT_WARN_LIMIT = $Y \times 2^N$

Range: 0 to 175°C

COMMAND	OT_WARN_LIMIT (51h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	1	1	0	1	0	1	1	0	1	1	1	0	0	0	0

UT_WARN_LIMIT (52h)

Definition: The UT_WARN_LIMIT command set the temperature at which the device should indicate an under-temperature warning alarm. In response to the UT_WARN_LIMIT being exceeded, the device: Sets the TEMPERATURE bit in STATUS_WORD, sets the UT_WARNING bit in STATUS_TEMPERATURE and notifies the host.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: DC40h (-30°C)

Units: Celsius

Equation: UT_WARN_LIMIT = $Y \times 2^N$

Range: -55°C to +25°C

COMMAND	UT_WARN_LIMIT (52h)															
Format	Linear-11

VIN_OV_WARN_LIMIT (57h)

Definition: Sets the VIN overvoltage warning threshold as defined by the table below. In response to the OV_WARN_LIMIT being exceeded, the device: Sets the NONE OF THE ABOVE and INPUT bits in STATUS_WORD, sets the VIN_OV_WARNING bit in STATUS_INPUT and notifies the host.

Paged or Global: Global

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: D360h (13.5V)

Units: V

Equation: VIN_OV_FAULT_LIMIT = $Y \times 2^N$

Range: 0 to 19V

COMMAND	VIN_OV_WARN_LIMIT (57h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	1	0	1	0	0	1	1	0	1	1	0	0	0	0	0

VIN_UV_WARN_LIMIT (58h)

Definition: Sets the VIN undervoltage warning threshold. If a VIN_UV_FAULT occurs, the input voltage must rise above VIN_UV_WARN_LIMIT to clear the fault, which provides hysteresis to the fault threshold. In response to the UV_WARN_LIMIT being exceeded, the device: Sets the NONE OF THE ABOVE and INPUT bits in STATUS_WORD, Sets the VIN_UV_WARNING bit in STATUS_INPUT, and notifies the host.

Paged or Global: Global

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: 1.10 x UVLO pin-strap setting

Units: V

Equation: VIN_UV_WARN_LIMIT = $Y \times 2^N$

Range: 0 to 19V

COMMAND	VIN_UV_WARN_LIMIT (58h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	UVLO pin-strapped value															

VIN_UV_FAULT_RESPONSE (5Ah)

Definition: Configures the VIN undervoltage fault response as defined by the table below. The retry time is the time between restart attempts.

Paged or Global: Global

Data Length in Bytes: 1

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: BFh (continuous retries, 280ms retry delay)

Units: Retry time unit = 35ms

COMMAND	VIN_UV_FAULT_RESPONSE (5Ah)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	See Following Table							
Default Value	1	0	0	0	0	0	0	0

© 2021 Bel Power Solutions & Protection

BIT	FIELD NAME	VALUE	DESCRIPTION
7:6	Response behavior, the device: Pulls SALRT low Sets the related fault bit in the status registers. Fault bits are only cleared by the CLEAR_FAULTS command.	00-01	Not used
		10	Disable and retry according to the setting in bits [5:3].
		11	Output is disabled while the fault is present. Operation resumes and the output is enabled when VIN rises above the VIN_UV_WARN_LIMIT.
5:3	Retry Setting	000	No retry. The output remains disabled until the fault is cleared.
		001-110	Not used
		111	Attempts to restart continuously, until it is commanded OFF (by the ENABLE pin or OPERATION command or both), bias power is removed, or another fault condition causes the unit to shut down. A retry is attempted after the input voltage rises above the VIN_UV_WARN_LIMIT. The time between the start of each attempt to restart is set by the value in bits [2:0] multiplied by 35ms.
2:0	Retry Delay	000-111	Retry delay time = (Value +1)*35ms. Sets the time between retries in 35ms increments. Range is 35ms to 280ms.

POWER_GOOD_ON (5Eh)

Definition: Sets the voltage threshold for power-good indication. Power-good asserts when the output voltage exceeds POWER_GOOD_ON and reasserts when the output voltage is less than VOUT_UV_FAULT_LIMIT. POWER_GOOD_ON should be set to a value above VOUT_UV_FAULT_LIMIT.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-16 Unsigned

Type: R/W

Protectable: Yes

Default Value: 0.9 x VSET pin-strap setting.

Units: V

COMMAND	POWER_GOOD_ON (5Eh)															
Format	Linear-16 Unsigned															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Default Value	0.9 x VSET Pin-strap Setting															

TON_DELAY (60h)

Definition: Sets the delay time from when the device is enabled to the start of VOUT rise.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: CA80h (5ms)

Units: ms

Equation: TON_DELAY = $Y \times 2^N$

Range: 0 to 5 seconds

COMMAND	TON_DELAY (60h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	1	0	0	1	0	1	0	1	0	0	0	0	0	0	0

TON_RISE (61h)

Definition: Sets the rise time of VOUT after ENABLE and TON_DELAY for single and dual channel operation. To adjust the rise time in 4-, 6- or 8-phase operation, use MULTI_PHASE_RAMP_GAIN (D5h).

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: CA80h (5ms)

Units: ms

Equation: TON_RISE = $Y \times 2^N$

Range: 0 to 100ms. Although values can be set below 0.50ms, rise time accuracy cannot be guaranteed. In addition, short rise times may cause excessive input and output currents to flow, thus triggering overcurrent faults at start-up.

COMMAND	TON_RISE (61h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	1	0	0	1	0	1	0	1	0	0	0	0	0	0	0

TOFF_DELAY (64h)

Definition: Sets the delay time from DISABLE to start of VOUT fall.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: CA80h (5ms)

Units: ms

Equation: TON_DELAY = $Y \times 2^N$

Range: 0 to 5 seconds

COMMAND	TOFF_DELAY (64h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	1	0	0	1	0	1	0	1	0	0	0	0	0	0	0

TOFF_FALL (65h)

Definition: Sets the fall time for VOUT after DISABLE and TOFF_DELAY. This setting is only valid in single or 2-phase operation. Setting the TOFF_FALL to values less than 0.5ms will cause the ZL8802 to turn-off both the high and low-side FETs (or disable the DrMOS device) immediately after the expiration of the TOFF_DELAY time. In 4-, 6- or 8-phase operation, the ZL8802 will always turn-off both the high and low-side FETs (or disable the DrMOS device) immediately after the expiration of the TOFF_DELAY time.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: CA80h (5ms)

Units: ms

Equation: TOFF_FALL = $Y \times 2^N$

Range: 0 to 100ms. Values less than 0.5ms will cause the ZL8802 to tri-state the PWM signal (turn-off both the high and low-side FETs) immediately after the expiration of the TOFF_DELAY time.

COMMAND	TOFF_FALL (65h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	1	0	0	1	0	1	0	1	0	0	0	0	0	0	0

STATUS_BYTE (78h)

Definition: The STATUS_WORD command returns two bytes of information with a summary of the unit's fault condition. Based on the information in these bytes, the host can get more information by reading the appropriate status registers. The low byte of the STATUS_WORD is the same register as the STATUS_BYTE (78h) command.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Bit Field

Type: Read Only

Protectable: No

Default Value: 00h

Units: N/A

COMMAND	STATUS_BYTE (78h)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

BIT NUMBER	STATUS BIT NAME	MEANING
7	BUSY	A fault was declared because the device was busy and unable to respond.
6	OFF	This bit is asserted if the unit is not providing power to the output, regardless of the reason, including simply not being enabled.
5	VOUT_OV_FAULT	An output overvoltage fault has occurred.
4	IOUT_OC_FAULT	An output overcurrent fault has occurred.
3	VIN_UV_FAULT	An input undervoltage fault has occurred.
2	TEMPERATURE	A temperature fault or warning has occurred.
1	CML	A communications, memory or logic fault has occurred.
0	None of the above	A fault other than the faults listed in bits 7:1 above has occurred. The source of the fault will be in bits 15:8 of the STATUS_WORD

© 2021 Bel Power Solutions & Protection

STATUS_WORD (79h)

Definition: The STATUS_WORD command returns two bytes of information with a summary of the unit's fault condition. Based on the information in these bytes, the host can get more information by reading the appropriate status registers. The low byte of the STATUS_WORD is the same register as the STATUS_BYTE (78h) command.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Bit Field

Type: Read Only

Protectable: No

Default Value: 0000h

Units: N/A

COMMAND	STATUS_WORD (79h)															
Format	Bit Field															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Function	See Following Table															
Default Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

BIT NUMBER	STATUS BIT NAME	MEANING
15	VOUT	An output voltage fault or warning has occurred.
14	IOUT	An output current fault has occurred.
13	INPUT	An input voltage fault or warning has occurred.
12	MFG_SPECIFIC	A manufacturer specific fault or warning has occurred.
11	POWER_GOOD #	The POWER_GOOD signal, if present, is negated. (Note 15)
10	NOT USED	Not used
9	OTHER	A bit in STATUS_VOUT, STATUS_IOUT, STATUS_INPUT, STATUS_TEMPERATURE, STATUS_CML, or STATUS_MFR_SPECIFIC is set.
8	Not Used	Not used
7	BUSY	A fault was declared because the device was busy and unable to respond.
6	OFF	This bit is asserted if the unit is not providing power to the output, regardless of the reason, including simply not being enabled.
5	VOUT_OV_FAULT	An output overvoltage fault has occurred.
4	IOUT_OC_FAULT	An output overcurrent fault has occurred.
3	VIN_UV_FAULT	An input undervoltage fault has occurred.
2	TEMPERATURE	A temperature fault or warning has occurred.
1	CML	A communications, memory or logic fault has occurred.
0	None of the above	A fault other than the faults listed in bits 7:1 above has occurred. The source of the fault will be in bits 15:8 of the STATUS_WORD

NOTE:15. If the POWER_GOOD# bit is set, this indicates that the POWER_GOOD signal, if present, is signaling that the output power is not good.

STATUS_VOUT (7Ah)

Definition: The STATUS_VOUT command returns one data byte with the status of the output voltage.

Paged or Global: Paged

Data Length in Bytes: 1

Data Format: Bit Field

Type: Read Only

Protectable: No

Default Value: 00h

Units: N/A

COMMAND	STATUS_VOUT (7Ah)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

BIT NUMBER	STATUS BIT NAME	MEANING
7	VOUT_OV_FAULT	Indicates an output overvoltage fault.
6	VOUT_OV_WARNING	Not used
5	VOUT_UV_WARNING	Not used
4	VOUT_UV_FAULT	Indicates an output undervoltage fault.
3:0	Not Used	Not used

STATUS_IOUT (7Bh)

Definition: The STATUS_IOUT command returns one data byte with the status of the output current.

Paged or Global: Paged

Data Length in Bytes: 1

Data Format: Bit Field

Type: Read Only

Protectable: No

Default Value: 00h

Units: N/A

COMMAND	STATUS_IOUT (7Bh)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

© 2021 Bel Power Solutions & Protection

BIT NUMBER	STATUS BIT NAME	MEANING
7	IOUT_OC_FAULT	An output overcurrent fault has occurred.
6	Not Used	Not used
5	Not Used	Not used
4	IOUT_UC_FAULT	An output undercurrent fault has occurred.
3:0	Not Used	Not used

STATUS_INPUT (7Ch)

Definition: The STATUS_INPUT command returns input voltage and input current status information.

Paged or Global: Global

Data Length in Bytes: 1

Data Format: Bit Field

Type: Read-only

Protectable: No

Default Value: 00h

Units: N/A

COMMAND	STATUS_INPUT (7Ch)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

BIT NUMBER	STATUS BIT NAME	MEANING
7	VIN_OV_FAULT	An input overvoltage fault has occurred.
6	VIN_OV_WARNING	An input overvoltage warning has occurred.
5	VIN_UV_WARNING	An input undervoltage warning has occurred.
4	VIN_UV_FAULT	An input undervoltage fault has occurred.
3:0	Not Used	Not used

STATUS_TEMPERATURE (7Dh)

Definition: The STATUS_TEMPERATURE command returns one byte of information with a summary of any temperature related faults or warnings.

Paged or Global: Paged

Data Length in Bytes: 1

Data Format: Bit Field

Type: Read-only

Protectable: No

Default Value: 00h

Units: N/A

COMMAND	STATUS_TEMP (7Dh)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

BIT NUMBER	STATUS BIT NAME	MEANING
7	OT_FAULT	An over-temperature fault has occurred.
6	OT_WARNING	An over-temperature warning has occurred.
5	UT_WARNING	An under-temperature warning has occurred.
4	UT_FAULT	An under-temperature fault has occurred.
3:0	Not Used	Not used

STATUS_CML (7Eh)

Definition: The STATUS_WORD command returns one byte of information with a summary of any communications, logic and/or memory errors.

Paged or Global: Global

Data Length in Bytes: 1

Data Format: Bit Field

Type: Read Only

Protectable: No

Default Value: 00h

Units: N/A

COMMAND	STATUS_CML (7Eh)

Access	R	R	R	R	R	R	R	R
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

BIT NUMBER	MEANING
7	Invalid or unsupported Power Management bus command was received.
6	The Power Management bus command was sent with invalid or unsupported data.
5	A packet error was detected in the Power Management bus command.
4:2	Not used
1	A Power Management bus command tried to write to a read-only or protected command, or a communication fault other than the ones listed in this table has occurred.
0	Not used

STATUS_MFR_SPECIFIC (80h)

Definition: The STATUS_MFR_SPECIFIC command returns one byte of information providing the status of the device's voltage monitoring and clock synchronization faults.

Paged or Global: Global

Data Length in Bytes: 1

Data Format: Bit Field

Type: Read Only

Protectable: No

Default Value: 00h

Units: N/A

COMMAND	STATUS_MFR_SPECIFIC (80h)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

BIT	FIELD NAME	MEANING
7	Not Used	Not used
6	DDC Warning	An error was detected on the DDC bus.
5	VMON UV Warning	The voltage on the VMON pin has dropped 10% below the level set by MFR_VMON_UV_FAULT.
4	VMON OV Warning	The voltage on the VMON pin has risen 10% above the level set by MFR_VMON_OV_FAULT.
3	External Switching Period Fault	Loss of external clock synchronization has occurred.
2	Not Used	Not used
1	VMON UV Fault	The voltage on the VMON pin has dropped below the level set by MFR_VMON_UV_FAULT.
0	VMON OV Fault	The voltage on the VMON pin has risen above the level set by MFR_VMON_OV_FAULT.

READ_VIN (88h)

Definition: Returns the input voltage reading.

Paged or Global: Global

Data Length in Bytes: 2

Data Format: Linear-11

Type: Read Only

Protectable: No

Default Value: N/A

Units: V

Equation: READ_VIN = $Y \times 2^N$

Range: N/A

COMMAND	READ_VIN (88h)															
Format	Linear-11

READ_VOUT (8Bh)

Definition: Returns the output voltage reading.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-16 Unsigned

Type: Read Only

Protectable: No

Default Value: N/A

Equation: READ_VOUT = READ_VOUT × 2^{-13}

Units: V

COMMAND	READ_VOUT (8Bh)															
Format	Linear-16 Unsigned															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

READ_TEMPERATURE_3 (8Fh)

Definition: Returns the temperature reading from the VMON/TMON pin when the device is configured to read temperature on the VMON/TMON pin by setting bit 12 in the USER_GLOBAL_CONFIG command to 1. The voltage on the VMON/TMON pin is converted to °C by the equation TEMPERTATURE 3 = (VMON voltage - 0.6V)/0.008. See MFR_VMON commands starting on page 85 (F5h, F6h, F8h, F9H) for fault limits when reading temperature on the VMON/TMON pin. When using the Intersil ISL9922X smart power stage, a 2:1 voltage divider is needed between the TMON pin of the ISL9922X and the VMON/TMON pin of the ZL8802.

Paged or Global: Global

Data Length in Bytes: 2

Data Format: Linear-11

Type: Read Only

Protectable: No

Default Value: N/A

Units: °C

Equation: READ_TEMPERATURE_3 = $Y \times 2^N$

Range: N/A

COMMAND	READ_TEMPERATURE_3 (8Fh)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A

READ_DUTY_CYCLE (94h)

Definition: Reports the actual duty cycle of the converter during the enable state.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: Read Only

Protectable: No

Default Value: N/A

Units: %

Equation: READ_DUTY_CYCLE = $Y \times 2^N$

Range: 0 to 100%

COMMAND	READ_DUTY_CYCLE (94h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

MFR_ID (99h)

Definition: MFR_ID sets a user defined identification string not to exceed 32 bytes. The sum total of characters in MFR_ID, MFR_MODEL, MFR_REVISION, MFR_LOCATION, MFR_DATE, MFR_SERIAL and USER_DATA_00 plus one byte per command cannot exceed 128bytes. This limitation includes multiple writes of this command before a STORE command. To clear multiple writes, perform a RESTORE, write this command then perform a STORE/RESTORE.

Paged or Global: Global

Data Length in Bytes: User defined

Data Format: ASCII, ISO/IEC 8859-1

Type: Block R/W

Protectable: Yes

Default Value: Null

Units: N/A

MFR_MODEL (9Ah)

Definition: MFR_MODEL sets a user defined model string not to exceed 32 bytes. The sum total of characters in MFR_ID, MFR_MODEL, MFR_REVISION, MFR_LOCATION, MFR_DATE, MFR_SERIAL and USER_DATA_00 plus one byte per command cannot exceed 128bytes. This limitation includes multiple writes of this command before a STORE command. To clear multiple writes, perform a RESTORE, write this command then perform a STORE/RESTORE.

Paged or Global: Global

Data Length in Bytes: User defined

Data Format: ASCII, ISO/IEC 8859-1

Type: Block R/W

Protectable: Yes

Default Value: Null

Units: N/A

MFR_REVISION (9Bh)

Definition: MFR_REVISION sets a user defined revision string not to exceed 32 bytes. The sum total of characters in MFR_ID, MFR_MODEL, MFR_REVISION, MFR_LOCATION, MFR_DATE, MFR_SERIAL and USER_DATA_00 plus one byte per command cannot exceed 128bytes. This limitation includes multiple writes of this command before a STORE command. To clear multiple writes, perform a RESTORE, write this command then perform a STORE/RESTORE.

Paged or Global: Global

Data Length in Bytes: User defined

Data Format: ASCII. ISO/IEC 8859-1

Type: Block R/W

Protectable: Yes

Default Value: Null

Units: N/A

© 2021 Bel Power Solutions & Protection

MFR_LOCATION (9Ch)

Definition: MFR_LOCATION sets a user defined location identifier string not to exceed 32 bytes. The sum total of characters in MFR_ID, MFR_MODEL, MFR_REVISION, MFR_LOCATION, MFR_DATE, MFR_SERIAL and USER_DATA_00 plus one byte per command cannot exceed 128bytes. This limitation includes multiple writes of this command before a STORE command. To clear multiple writes, perform a RESTORE, write this command then perform a STORE/RESTORE.

Paged or Global: Global

Data Length in Bytes: User defined

Data Format: ASCII. ISO/IEC 8859-1

Type: Block R/W

Protectable: Yes

Default Value: Null

Units: N/A

MFR_DATE (9Dh)

Definition: MFR_DATE sets a user defined date string not to exceed 32 bytes. The sum total of characters in MFR_ID, MFR_MODEL, MFR_REVISION, MFR_LOCATION, MFR_DATE, MFR_SERIAL and USER_DATA_00 plus one byte per command cannot exceed 128bytes. This limitation includes multiple writes of this command before a STORE command. To clear multiple writes, perform a RESTORE, write this command then perform a STORE/RESTORE.

Paged or Global: Global

Data Length in Bytes: User defined

Data Format: ASCII. ISO/IEC 8859-1

Type: Block R/W

Protectable: Yes

Default Value: Null

Units: N/A

MFR_SERIAL (9Eh)

Definition: MFR_SERIAL sets a user defined serialized identifier string not to exceed 32 bytes. The sum total of characters in MFR_ID, MFR_MODEL, MFR_REVISION, MFR_LOCATION, MFR_DATE, MFR_SERIAL and USER_DATA_00 plus one byte per command cannot exceed 128bytes. This limitation includes multiple writes of this command before a STORE command. To clear multiple writes, perform a RESTORE, write this command then perform a STORE/RESTORE.

USER_CONFIG (D1h)

Definition: Configures several user-level features. This command should be saved immediately after being written to the desired user or default store. This is recommended when written as an individual command or as part of a series of commands in a configuration file or script.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: Set by CFG pin-strap setting

Units: N/A

COMMAND	USER_CONFIG (D1h)															
Format	Bit Field															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	See Following Table															
Default Value	CFG Pin-strap Setting															

USER_CONFIG (D1h)

BIT	FIELD NAME	VALUE	SETTING	DESCRIPTION
15:11	Minimum Duty Cycle	00000	0-31d	Sets the minimum duty-cycle to 2X(VALUE+1)/512. Must be enabled with Bit 7
10	Not Used	1	Not Used	Not used
9:8	Not Used	00	Not Used	Not used
7	Minimum Duty Cycle Control	0	Disable	Control for minimum duty cycle
		1	Enable	
6	Not Used	0	Not Used	Not used
5	VSET Select	0	VSET0	0 = Uses only VSET0 to set the pin-strapped output voltage
		1	VSET1	1 = Uses only VSET1 to set the pin-strapped output voltage
4	Not Used	0	Not Used	Not used
3	PWML disabled state	0	Low when disabled	PWML is low (off) when device is disabled (bit 3 set to 0), or high (on) when device is disabled (bit 3 set to 1)
		1	High when disabled	
2	Power-good Configuration	0	Open Drain	0 = PG is open-drain output
		1	Push-Pull	1 = PG is push-pull output
1	XTEMP Enable	0	Disable	Enable external temperature sensor
		1	Enable	
0	XTEMP Fault Select	0	Disable	Selects external temperature sensor to determine temperature faults

IIN_CAL_GAIN (D2h)

Definition: Sets the effective impedance across the current sense circuit for use in calculating input current at +25°C.

Paged or Global: Global

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: C200h (2mΩ)

Units: mΩ

Equation: IIN_CAL_GAIN = $Y \times 2^N$

COMMAND	IIN_CAL_GAIN (D2h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	1	0	0	0	0	1	0	0	0	0	0	0	0	0	0

DDC_CONFIG (D3h)

Definition: Configures DDC addressing and current sharing for up to 8 phases. To operate as a 2-phase controller, set both phases to the same rail ID, set phases in rail to 2, then set each phase ID sequentially as 0 and 1. To operate as a 4-phase controller, set all phases to the same rail ID, set phases in rail to 4, then set each phase ID alternately, for example, the first ZL8802 will be set to 0 and 2, the second ZL8802 will be set to 1 and 3. The ZL8802 will automatically equally offset the phases in the rail. Phase spreading is done automatically as part of the DDC_CONFIG command. When using CFG pin-strap settings, the DDC_CONFIG command is set automatically.

NOTE: The output MUST be connected to VSEN0P and VSEN0N when operating as a 2-phase controller.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: Power Management bus address pin-strap dependent.

Units: N/A

COMMAND	DDC_CONFIG (D3h)															
Format	Bit Field

2:0	Phases In Rail	0 to 7	0	Identifies the number of phases on the same rail (+1)

POWER_GOOD_DELAY (D4h)

Definition: Sets the delay applied between the output exceeding the PG threshold (POWER_GOOD_ON) and asserting the PG pin. The delay time can range from 0ms up to 500ms, in steps of 125ns. A 1ms minimum configured value is recommended to apply proper debounce to this signal.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: BA00h, 1ms

Units: ms

Equation: POWER_GOOD_DELAY = $Y \times 2^N$

Range: 0 to 500ms

COMMAND	POWER_GOOD_DELAY (D4h)															
Format	Linear-11															
Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	Signed Exponent, N					Signed Mantissa, Y										
Default Value	1	0	1	1	1	0	1	0	0	0	0	0	0	0	0	0

MULTI_PHASE_RAMP_GAIN (D5h)

Definition: MULTI_PHASE_RAMP_GAIN command value indirectly determines the output voltage rise time during the turn-on ramp. Typical gain values range from 1 to 10. Lower gain values produce longer ramp times.

MULTI_PHASE_RAMP_GAIN mode is automatically selected when the ZLS8802 is configured to operate in a 4-phase current sharing group. When in MULTI_PHASE_RAMP_GAIN mode, the turn-on ramp up is done with the high bandwidth ASCR control circuitry disabled, resulting in a lower loop bandwidth during start-up ramps. Once POWER_GOOD has been asserted, ASCR circuitry is enabled and the ZLS8802 operates normally. When MULTI_PHASE_RAMP_GAIN mode is enabled, soft-off ramps are not allowed (TOFF_FALL is ignored). When the ZL8802 is commanded to shut down, the PWMHO/1 output is tri-stated, turning both the high-side and low-side MOSFETs off, and the PWML0/1 pin is pulled low (DrMOS disabled). Large load current transitions during multiphase ramp-ups will cause output voltage discontinuities.

When the phase count is 2; i.e., when the ZL8802 is operating standalone, ASCR is enabled at all times and all commands associated with turn-on and turn-off (TON_RISE, TOFF_FALL, Soft-Off) operate normally.

Rise time can be calculated using Equation:

Rise time = VOUT_COMMAND / {14 • Input Voltage • FREQUENCY_SWITCH (in MHz) • MULTI_PHASE_RAMP_GAIN}

Paged or Global: Global

Data Length in Bytes: 1

Data Format: Custom

Type: R/W

Protectable: Yes

Default Value: 03h

Units: N/A

MFR_SMBALERT_MASK (DBh)

BYTE	STATUS BYTE NAME	MEANING
6	STATUS_MFR_SPECIFIC	Mask manufacturer specific faults as identified in the STATUS_MFR_SPECIFIC byte.
5	STATUS_OTHER	Not used
4	STATUS_CML	Mask communications, memory or logic specific faults as identified in the STATUS_CML byte.
3	STATUS_TEMPERATURE	Mask temperature specific faults as identified in the STATUS_TEMPERATURE byte
2	STATUS_INPUT	Mask input specific faults as identified in the STATUS_INPUT byte
1	STATUS_IOUT	Mask output current specific faults as identified in the STATUS_IOUT byte
0	STATUS_VOUT	Mask output voltage specific faults as identified in the STATUS_VOUT byte

TEMPCO_CONFIG (DCh)

Definition: Configures the correction factor and temperature measurement source when performing temperature coefficient correction for current sense. TEMPCO_CONFIG values are applied as negative correction to a positive temperature coefficient. TEMPCO_CONFIG should be set to 3900ppm (27h) when using inductor DCR current sensing in order to compensate for the variation in inductor resistance due to the temperature coefficient of copper. When using the ISL9922X Smart Power Stage, TEMPCO_CONFIG should be set to 0ppm (00h) since the IMON signal from the ISL9922X is internally compensated for temperature.

Paged or Global: Paged

Data Length in Bytes: 1

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: 00h (0ppm/°C, copper)

Equation: To determine the hex value of the Tempco Correction factor (TC) for current scale of a power stage current sensing, first determine the temperature coefficient of resistance for the sensing element, a. This is found with Equation:

$$\alpha = \frac{R_{REF} - R}{R_{REF}\,(T_{REF} - T)}$$

Where:

R = Sensing element resistance at temperature “T”

R_{REF} = Sensing element resistance at reference temperature T_{REF}

a = Temperature coefficient of resistance for the sensing element material

T = Temperature measured by temperature sensor, in degrees Celsius

T_{REF} = Reference temperature that a is specified at for the sensing element material

After a is determined, convert the value in units of 100ppm/°C. This value is then converted to a hex value with Equation:

$$TC = \frac{a \times 10^6}{100}$$

Range: 0 to 12700ppm/°C

© 2021 Bel Power Solutions & Protection

COMMAND	TEMPCO_CONFIG (DCh)							
Format	Bit Field							
Bit Position	7	6	5	4	3	2	1	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Function	See Following Table							
Default Value	0	0	0	0	0	0	0	0

BITS	PURPOSE	VALUE	DESCRIPTION
7	Selects the temp sensor source for tempco correction	0	Selects the internal temperature sensor
		1	Selects the XTEMP pin for temperature measurements (2N3904 Junction) Note that XTEMP must be enabled in USER_CONFIG, bit 1.
6:0	Sets the tempco correction in units of 100ppm/°C for IOUT_CAL_GAIN	TC	RSEN (DCR) = IOUT_CAL_GAIN x (1+TC x (T-25)) Where RSEN = resistance of sense element

PINSTRAP_READ_STATUS (DDh)

Definition: Reads back 7 bytes of 8 bit values that represent the pin-strap settings of each of the device's pin-strap pins. This value corresponds to a resistor value, a high, a low or an open condition. The pin decode values correspond to pin-strap settings according to Table:

TABLE.

ASCR_CONFIG (DFh)

Definition: Allows user configuration of ASCR settings. ASCR gain and residual value are automatically set by the ZL8802 based on input voltage and output voltage. ASCR gain is analogous to bandwidth, ASCR residual is analogous to damping. To improve load transient response performance, increase ASCR gain. To lower transient response overshoot, increase ASCR residual. Increasing ASCR gain can result in increased PWM jitter and should be evaluated in the application circuit. Excessive ASCR gain can lead to excessive output voltage ripple. Increasing ASCR residual to improve transient response damping can result in slower recovery times, but will not affect the peak output voltage deviation. Typical ASCR gain settings range from 100 to 1000, and ASCR residual settings range from 10 to 90.

Paged or Global: Paged

SEQUENCE (E0h)

Definition: Identifies the Rail DDC ID of the prequel and sequel rails when performing multi-rail sequencing. The device will enable its output when its EN or OPERATION enable state, as defined by ON_OFF_CONFIG, is set and the prequel device has issued a power-good event on the DDC bus as a result of the prequel's Power-good (PG) signal going high. The device will disable its output (using the programmed delay values) when the sequel device has issued a power-down event on the DDC bus at the completion of its ramp-down (its output voltage is 0V).

The data field is a two-byte value. The most-significant byte contains the 5-bit Rail DDC ID of the prequel device. The least-significant byte contains the 5-bit Rail DDC ID of the sequel device. The most significant bit of each byte contains the enable of the prequel or sequel mode. This command overrides the corresponding sequence configuration set by the CONFIG pin settings.

Paged or Global: Paged

TRACK_CONFIG (E1h)

Definition: Configures the voltage tracking modes of the device. Single device (Channel 0, Channel 1 or 2-phase) tracking is supported. Tracking as part of a 4-, 6- or 8-phase current sharing group is not supported. When tracking, the TOFF_DELAY in the tracking device must be greater than TOFF_DELAY + TOFF_FALL in the device being tracked. When configured to track, VOUT_COMMAND must be set to the desired steady state output voltage.

Data Length in Bytes: 1

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: 00h

Units: N/A

		1	VTRK Voltage	Output Voltage is Limited by VTRK Voltage.
0	Not Used	0	Not Used	Not used

DDC_GROUP (E2h)

Definition: Rails (output voltages) are assigned Group numbers in order to share specified behaviors. The DDC_GROUP command configures fault spreading group ID and enable, broadcast OPERATION group ID and enable, and broadcast VOUT_COMMAND group ID and enable. Note that DDC Groups are separate and unique from DDC Rail IDs (see "DDC_CONFIG (D3h)"). Current sharing rails need to be in the same DDC Group in order to respond to broadcast VOUT_COMMAND and OPERATION commands. Power fail event responses (and phases) are automatically spread in Phase 0 and 1 when the ZL8802 is operating in 2-phase current sharing mode when it is configured using DDC_CONFIG, regardless of its setting in DDC_GROUP.

Paged or Global: Paged

MFR_IOUT_OC_FAULT_RESPONSE (E5h)

Definition: Configures the IOUT overcurrent fault response as defined by the table below. The command format is the same as the Power Management bus standard fault responses except that it sets the overcurrent status bit in STATUS_IOUT. The retry time is the time between restart attempts.

Paged or Global: Paged

Data Length in Bytes: 1

Data Format: Bit Field

Type: R/W

Protectable: Yes

Default Value: 80h (immediate shutdown, no retries)

Units: Retry time

unit = 35ms

MFR_IOUT_OC_FAULT_RESPONSE (E5h)

BIT	FIELD NAME	VALUE	DESCRIPTION
7:6	Response behavior, for all modes, the device: • Pulls SALRT low • Sets the related fault bit in the status registers. Fault bits are only cleared by the CLEAR_FAULTS command.	00	Not used
		01	Not used
		10	Disable without delay and retry according to the setting in bits 5:3.
		11	Output is disabled while the fault is present. Operation resumes and the output is enabled when the fault is no longer present.
5:3	Retry Setting	000	No retry. The output remains disabled until the fault is cleared.
		001-110	Not used
		111	Attempts to restart continuously, without checking if the fault is still present, until it is commanded OFF (by the CONTROL pin or OPERATION command or both), bias power is removed, or another fault condition causes the unit to shut down. The time between the start of each attempt to restart is set by the value in bits [2:0] multiplied by 35ms.
2:0	Retry Delay	000-111	Retry delay time = (Value +1)*35ms. Sets the time between retries in 35ms increments. Range is 35ms to 280ms.

MFR_IOUT_UC_FAULT_RESPONSE (E6h)

Definition: Configures the IOUT undercurrent fault response as defined by the table below. The command format is the same as the Power Management bus standard fault responses except that it sets the undercurrent status bit in STATUS_IOUT. The retry time is the time between

restart attempts.

Data Length in Bytes: 1

IOUT_AVG_OC_FAULT_LIMIT (E7h)

Definition: Sets the IOUT average overcurrent fault threshold. For down-slope sensing, this corresponds to the average of all the current samples taken during the (1-D) time interval, excluding the current sense blanking time (which occurs at the beginning of the 1-Dinterval). For up-slope sensing, this corresponds to the average of all the current samples taken during the D time interval, excluding the current sense blanking time (which occurs at the beginning of the D interval). This feature shares the OC fault bit operation (in STATUS_IOUT) and OC fault response with IOUT_ OC_FAULT_LIMIT.

Paged or Global: Paged

Data Length in Bytes: 2

Data Format: Linear-11

Type: R/W

Protectable: Yes

Default Value: CFG pin-strap setting

Units: Amperes

Equation: IOUT_AVG_OC_FAULT_LIMIT = $Y \times 2^N$

Range: -100A to 100A

		10	Use external clock
		11	Not used
0	Not Used	0	Not used

SNAPSHOT (EAh)

Definition: The SNAPSHOT command is a 32-byte read-back of parametric and status values. It allows monitoring and status data to be stored to flash either during a fault condition or via a system-defined time using the SNAPSHOT_CONTROL command. Snapshot is continuously updated in RAM and can be read using the SNAPSHOT command. When a fault occurs, the latest snapshot in RAM is stored to flash. Snapshot data can read back by writing a 01h to the SNAPSHOT_CONTROL command, then reading SNAPSHOT.

LEGACY_FAULT_GROUP (F0h)

Definition: This command allows the ZL8802 to sequence and fault spread with devices other than the ZL8800 family of ICs. This command sets which rail DDC IDs should be listened to for fault spreading information. The data sent is a 4-byte, 32-bit bit vector where every bit represents a rail's DDC ID. A bit set to 1 indicates a device DDC ID to which the configured device will respond upon receiving a fault spreading event. In this vector, bit 0 of byte 0 corresponds to the rail with DDC ID 0. Following through, Bit 7 of byte 3 corresponds to the rail with DDC ID 31.

NOTE: The device/rail's own DDC ID should not be set within the LEGACY_FAULT_GROUP command for that device/rail.

All devices in a current share rail (devices other than the ZL8800 family ICs) must shut down for the rail to report a shutdown.

If fault spread mode is enabled in USER_CONFIG, the device will immediately shut down if one of its DDC_GROUP members fail. The device/rail will attempt its configured restart only after all devices/rails within the DDC_GROUP have cleared their faults.

If fault spread mode is disabled in USER_CONFIG, the device will perform a sequenced shutdown as defined by the SEQUENCE command setting. The rails/devices in a sequencing set only attempt their configured restart after all faults have cleared within the DDC_GROUP. If fault spread mode is disabled and sequencing is also disabled, the device will ignore faults from other devices and stay enabled.

SNAPSHOT_CONTROL (F3h)

Definition: Writing a 01h will cause the device to copy the current SNAPSHOT values from NVRAM to the 32-byte SNAPSHOT command parameter. Writing a 02h will cause the device to write the current SNAPSHOT values to NVRAM, 03h will erase all SNAPSHOT values from NVRAM. Write (02h) and Erase (03h) may only be used when the device is disabled. All other values will be ignored. SNAPSHOT 03h must be written to the device when the device is DISABLED. Data will not be updated, or written to NVRAM after a fault occurs until the SNAPSHOT 03h command has been written.

SECURITY_LEVEL (FAh)

Definition: The device provides write protection for individual commands. Each bit in the UNPROTECT parameter controls whether its corresponding command is writeable (commands are always readable). If a command is not writeable, a password must be entered in order to change its parameter (i.e., to enable writes to that command). There are two types of passwords, public and private. The public password provides a simple lock-and-key protection against accidental changes to the device. It would typically be sent to the device in the application prior to making changes. Private passwords allow commands marked as nonwritable in the UNPROTECT parameter to be changed. Private passwords are intended for protecting default-installed configurations and would not typically be used in the application. Each store (USER and DEFAULT) can have its own UNPROTECT string and private password. If a command is marked as nonwritable in the DEFAULT UNPROTECT parameter (its corresponding bit is cleared), the private password in the DEFAULT store must be sent in order to change that command. If a command is writeable according to the default UNPROTECT parameter, it may still be marked as nonwritable in the user store UNPROTECT parameter. In this case, the user private password can be sent to make the command writeable.

The device supports four levels of security. Each level is designed to be used by a particular class of users, ranging from module manufacturers to end users, as discussed below. Levels 0 and 1 correspond to the public password. All other levels require a private password. Writing a private password can only raise the security level. Writing a public password will reset the level down to 0 or 1.

Figure on next page shows the algorithm used by the device to determine if a particular command write is allowed.

SECURITY_LEVEL (FAh)

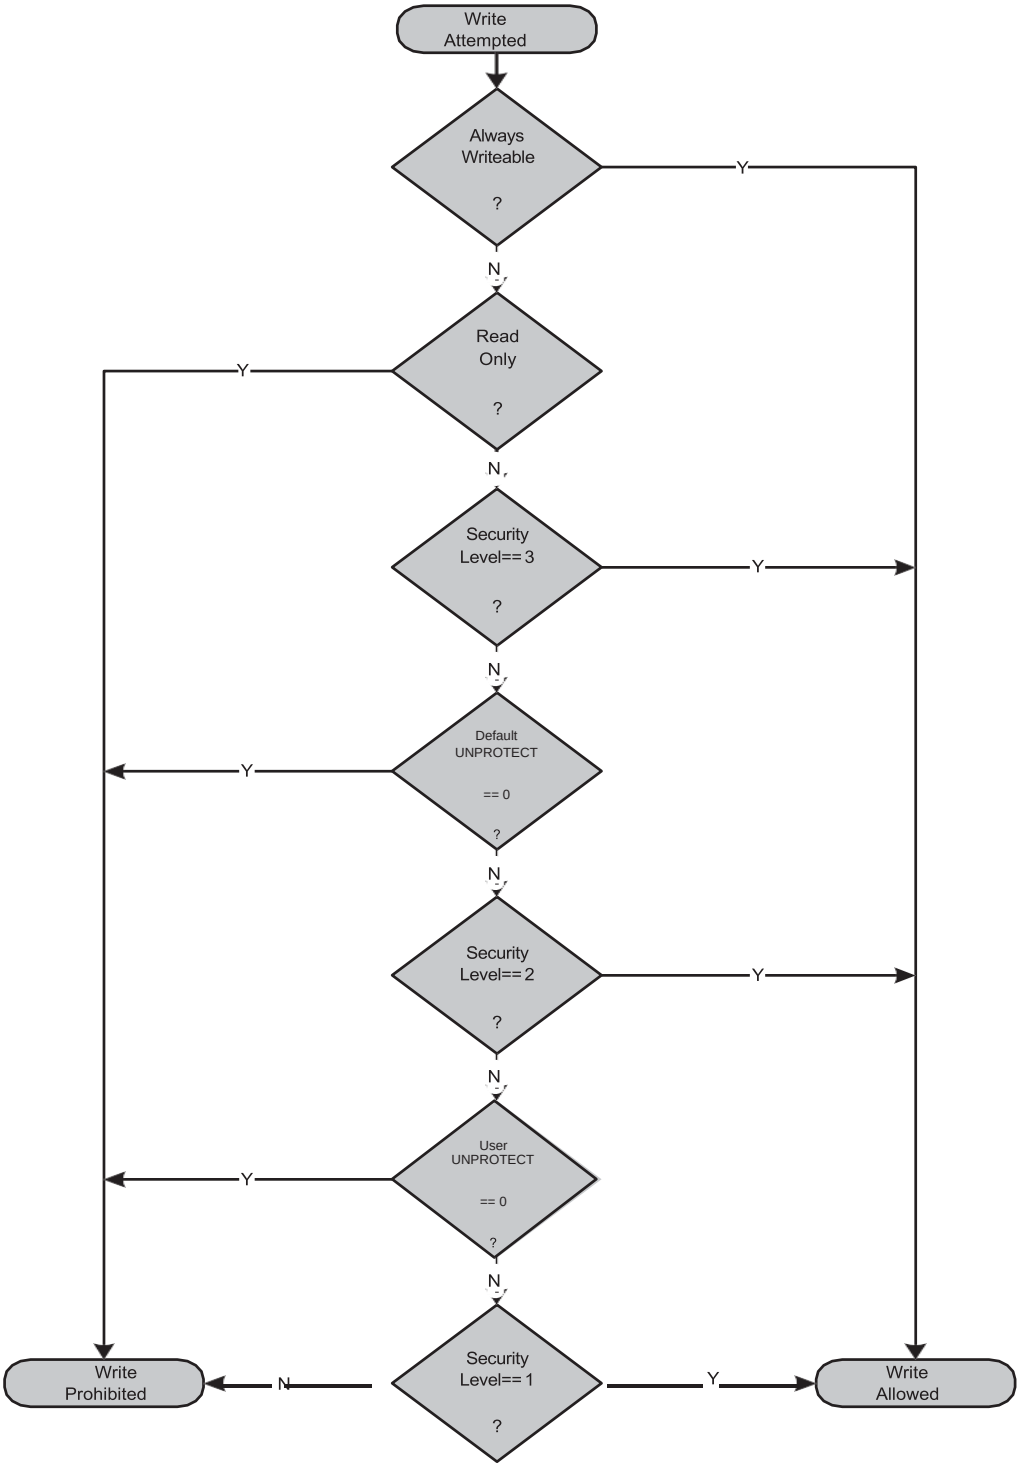

Figure 55. ALGORITHM USED TO DETERMINE WHEN A COMMAND IS WRITEABLE

© 2021 Bel Power Solutions & Protection

Security Level 3 – Module Vendor

Level 3 is intended primarily for use by module vendors to protect device configurations in the default store. Clearing a UNPROTECT bit in the default store implies that a command is writeable only at Level 3 and above. The device's security level is raised to Level 3 by writing the private password value previously stored in the default store. To be effective, the module vendor must clear the UNPROTECT bit corresponding to the STORE_DEFAULT_ALL and RESTORE_DEFAULT commands. Otherwise, Level 3 protection is ineffective since the entire store could be replaced by the user, including the enclosed private password.

Security Level 2 – User

Level 2 is intended for use by the end user of the device. Clearing a UNPROTECT bit in the user store implies that a command is writeable only at Level 2 and above. The device's security level is raised to Level 2 by writing the private password value previously stored in the User Store. To be effective, the user must clear the UNPROTECT bit corresponding to the STORE_USER_ALL, RESTORE_DEFAULT_ALL, STORE_DEFAULT_ALL and RESTORE_DEFAULT commands. Otherwise, Level 2 protection is ineffective since the entire store could be replaced, including the enclosed private password.

Security Level 1 – Public

Level 1 is intended to protect against accidental changes to ordinary commands by providing a global write-enable. It can be used to protect the device from erroneous bus operations. It provides access to commands whose UNPROTECT bit is set in both the default and User Store. Security is raised to Level 1 by writing the public password stored in the user store using the PUBLIC_PASSWORD command. The public password stored in the default store has no effect.

Security Level 0 - Unprotected

Level 0 implies that only commands which are always writeable (e.g., PUBLIC_PASSWORD) are available. This represents the lowest authority level and hence the most protected state of the device. The level can be reduced to 0 by using PUBLIC_PASSWORD to write any value which does not match the stored public password.

PRIVATE_PASSWORD (FBh)

Default Value: 00000000h

Units: N/A

UNPROTECT (FDh)

Definition: Sets a 256-bit (32-byte) parameter which identifies which commands are to be protected against write-access at lower security levels. Each bit in this parameter corresponds to a command according to the command's code. The command with a code of 00h (PAGE) is protected by the least-significant bit of the least-significant byte, followed by the command with a code of 01h and so forth. Note that all possible commands have a corresponding bit regardless of whether they are protectable or supported by the device. Clearing a command's UNPROTECT bit indicates that write-access to that command is only allowed if the device's security level has been raised to an appropriate level. The UNPROTECT bits in the default store require a security level 3 or greater to be writeable. The UNPROTECT bits in the user store require a security level of 2 or higher.

Data Length in Bytes: 32

Paged or Global: Global

Data Format: Custom

Type: Block R/W

Protectable: No

Default Value: FF…FFh

Units: N/A

28. SOLDERING INFORMATION

The SRBP-80A2P0 modules are designed to be compatible with reflow soldering process. The suggested Pb-free solder paste is Sn/Ag/Cu(SAC). The recommended reflow profile using Sn/Ag/Cu solder is shown in the following. Recommended reflow peak temperature is 245 °C. This profile should be used only as a guideline. Many other factors influence the success of SMT reflow soldering. Since your production environment may differ, please thoroughly review these guidelines with your process engineers.

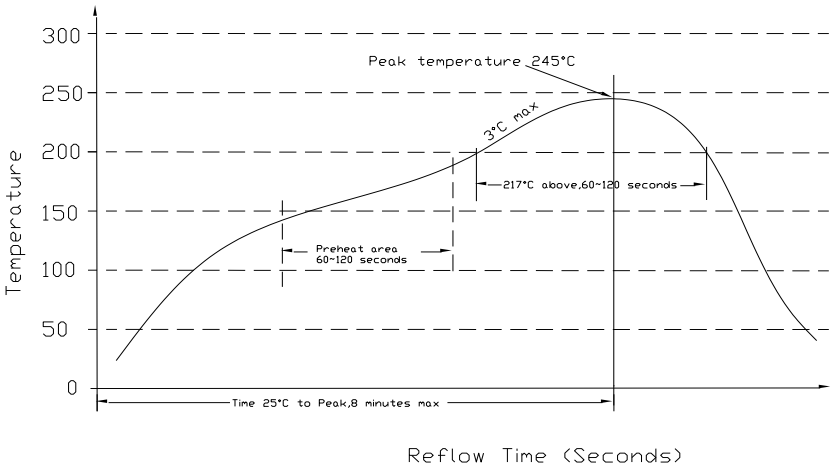

Figure 56.

29. MSL RATING

The SRBP-80A2P0 modules have a MSL rating of 3.

30. STORAGE AND HANDLING

The SRBP-80A2P0 modules are designed to be compatible with J-STD-033 Rev: A (Handling, Packing, Shipping and Use of Moisture /Reflow Sensitive surface Mount devices). Moisture barrier bags (MBB) with desiccant are applied. The recommended storage environment and handling procedure is detailed in J-STD-033.

31. PRE-BAKING

This component has been designed, handled, and packaged ready for Pb-free reflow soldering. If the assembly shop follows J-STD-033 guidelines, no pre-bake of this component is required before being reflowed to a PCB. However, if the J-STD-033 guidelines are not followed by the assembler, Bel recommends that the modules should be pre-baked @ 120~125°C for a minimum of 4 hours (preferably 24 hours) before reflow soldering. Our packaging tray can only withstand temperature of 70°C max.

32. MECHANICAL DIMENSIONS

OUTLINE

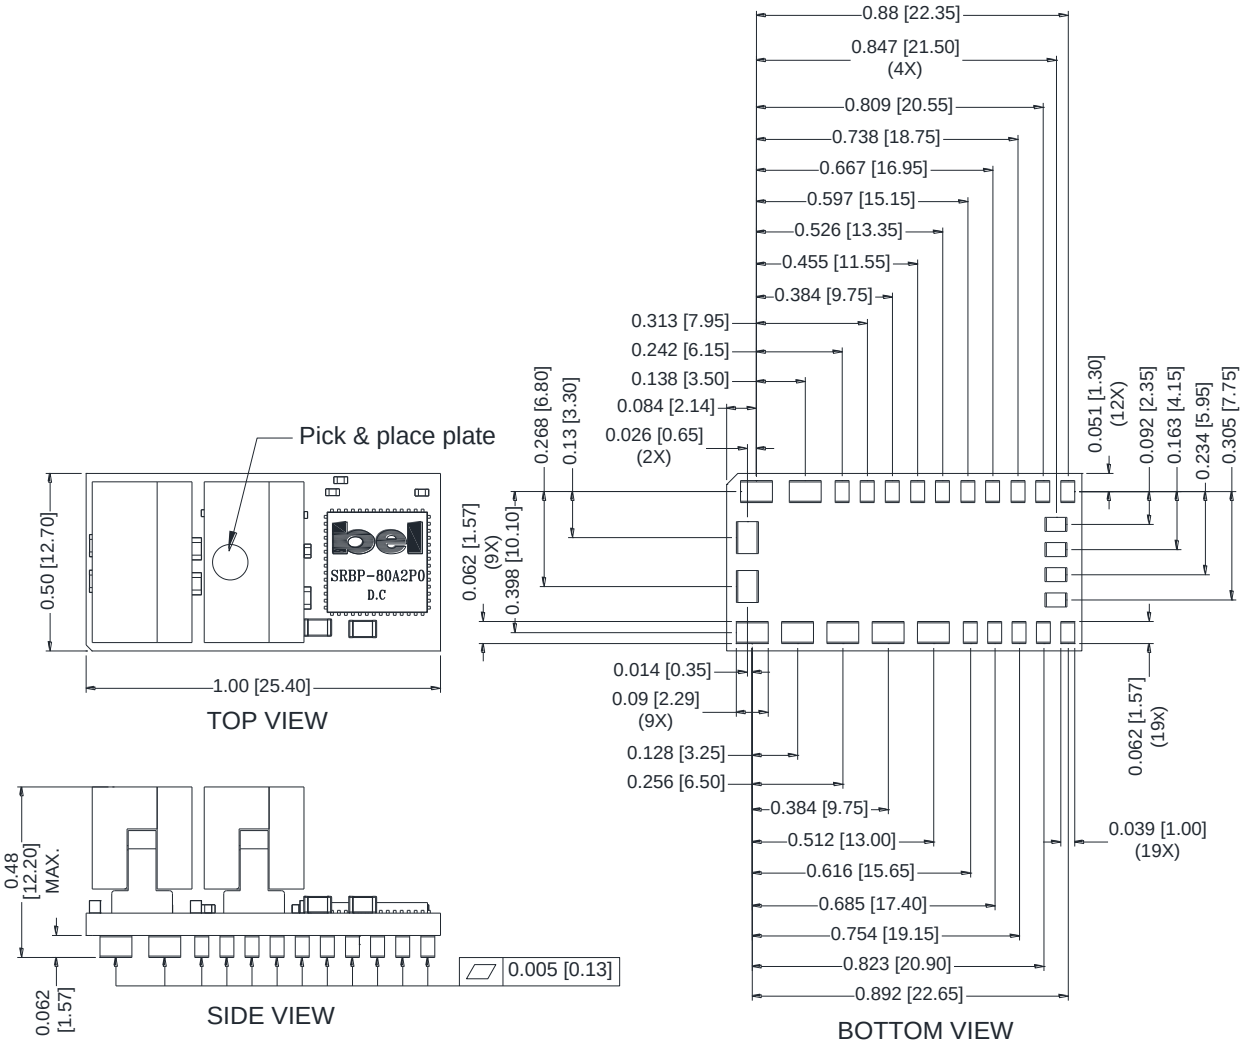

Figure 57. Outline

NOTES:

1) All Pins: Material - Copper Alloy;
   Finish – Matte Tin
2) Un-dimensioned components are shown for visual reference only.
3) All dimensions in inches (mm); Tolerances: x.xx +/-0.02 inch. (x.x +/-0.5 mm); x.xxx +/-0.010 inch. (x.xx +/-0.25 mm).

PIN CONNECTIONS

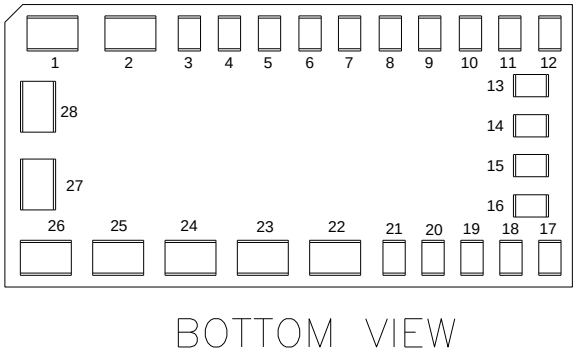

Figure 59. Pins

PIN	FUNCTION
1	Vin
2	GND
3	PG1
4	PG2
5	EN1
6	EN2
7	SYNC
8	SHARE
9	ADDR
10	SCL
11	SDA
12	SALERT
13	SGND
14	ASCRCFG

PIN	FUNCTION
15	CFG
16	Vtrim1
17	VS1+
18	VS1-
19	Vtrim2
20	VS2-
21	VS2+
22	Vout1
23	Vout1
24	GND
25	Vout2
26	Vout2
27	GND
28	Vin

NOTE:
1) Un-dimensioned components are shown for visual reference only.
2) All dimensions in inches (mm); Tolerances: x.xx +/-0.02 inch. (x.x +/-0.5 mm); x.xxx +/-0.010 inch. (x.xx +/-0.25 mm).

PIN	NAME	TYPE	FUNCTION
1	Vin	Power	Input voltage.
2	GND	Power	Power ground.
3	PG1	Out	Vo1 power-good output. Default is push-pull, can be set as an open-drain.
4	PG2	Out	Vo2 power-good output. Default is push-pull, can be set as an open-drain.
5	EN1	In	Enable or disable Vo1 of the module.
6	EN2	In	Enable or disable Vo2 of the module
7	SYNC	In/Out	Clock synchronization input. Set the switching frequency. Refer to Switching Frequency Setting.
8	SHARE	In/Out	Current sharing, communication bus between multiple modules.
9	ADDR	In	Serial address select pin. Connect resistor to SGND to assign unique address for each individual module.
10	SCL	In/Out	Serial clock. Requires a pull-up resistor to a 2.5V to 5.5V source, the source must be always on.
11	SDA	In/Out	Serial data. Requires a pull-up resistor to a 2.5V to 5.5V source, the source must be always on.
12	ALERT	Out	Serial alert. Asserted low when any fault or alarms are triggered. Requires a pull-up resistor to a 2.5V to 5.5V source, the source must be always on.
13	SGND	Power	Signal ground. SGND is shorted to GND internally.
14	ASCRCFG	In	Control loop configuration settings. Refer to control Loop(ASCR) Setting.
15	CFG	In	Setting current sense, current limit and operating mode. Refer to Configuration Setting.
16	Vtrim1	In	Setting output voltage Vo1. Connect resistor to SGND. Refer to Trim/Output Voltage Adjustment.
17	VS1+	In	Positive sense for Vo1. Connect to Vo1 close to the load.
18	VS1-	In	Negative sense fro Vo1. Connect to GND close to the load.
19	Vtrim2	In	Setting output voltage Vo2. Connect resistor to SGND. Refer to Trim/Output Voltage Adjustment.
20	VS2-	In	Negative sense fro Vo2. Connect to GND close to the load.
21	VS2+	In	Positive sense for Vo2. Connect to Vo2 close to the load.
22	Vo1	Power	Output Vo1.
23	Vo1	Power	Output Vo1.
24	GND	Power	Power ground.
25	Vo2	Power	Output Vo2.
26	Vo2	Power	Output Vo2.
27	GND	Power	Power ground.
28	Vin	Power	Input voltage.

34. REVISION HISTORY

DATE	REVISION	CHANGES DETAIL	APPROVAL
2017-07-14	AA	First release	Z.Tang
2017-11-08	AB	Update the MD, Startup & Shutdown, PG, TR, NR, TD and OCP.	Z.Tang
2018-03-26	AC	Update the Abs Max, Input Specs, Output Specs and Switching Frequency	Z.Tang
2018-04-23	AD	Update the MD, Model Selection, Output Specifications, General, OCP, OTP, Input under-voltage lockout and Power Good. Add Trim, ASCR, RCFG, SYNC, Package, SHARE and Power Management bus	Z.Tang
2019-06-03	AE	Delete OVP.	XF.Jiang
2019-08-06	AF	Update the Load Regulation in 4-phase, 6-phase 8-phase Mode. Delete package.	XF.Jiang
2021-03-17	AG	Add object ID, MTBF and input reflected ripple current waveform.	XF.Jiang
